## 1. Summary

The Forter cartridge adds the power of Forter's new generation fraud prevention to the Salesforce Commerce Cloud platform, to meet the challenges faced by modern enterprise e-commerce. Only Forter provides fully automated, real-time Decision as a Service™ fraud prevention, backed by a 100% chargeback guarantee.

The system eliminates the need for rules, scores or manual reviews, making fraud prevention friction-free. Every transaction receives an instant approve/decline decision, removing checkout friction and the delays caused by manual reviews.

The Forter cartridge provides fraud prevention that is invisible to buyers and empowers merchants with increased approvals, smoother checkout and the near elimination of false positives - meaning more sales and happier customers.

Behind the scenes, Forter's machine learning technology combines advanced cyber intelligence with behavioral and identity analysis to create a multi-layered fraud detection mechanism.

The result is best for online merchants, and best for online customers.

## 2. Component Overview

### 2.1 Functional Overview

---

The Forter cartridge links your Salesforce Commerce Cloud platform to Forter's sophisticated fraud fighting system. Each order is analyzed and a real-time approve or decline decision returned which is covered by a full fraud chargeback guarantee.

Merchants can configure the capture/void settings according to policy and preference.

All decisions can be seen in the Salesforce Commerce Cloud platform, and merchants can see more details relating to each transaction within the Forter Decision Dashboard.

### 2.2 Use Cases

---

There are number of use cases that may be seen with the Forter cartridge. Below are a few examples of use cases, with a description of the role Forter plays in the checkout process and where it fits into the customer experience.

UC - 1	Registered Customer: Approved Order Status Validation
<p>This use case describes the high level steps in which a registered customer successfully creates an order and the order is Approved.</p>	<ol style="list-style-type: none"> <li>1. The customer creates an account and logs in with the newly created account using email <i>approve@forter.com</i>.</li> <li>2. The customer selects an item, adds it to the cart and proceeds to the cart page.</li> <li>3. The customer clicks on the <b>Checkout</b> button and fills out the shipping form requirements.</li> <li>4. The customer clicks on the <b>Continue</b> button and proceeds to fill in the billing form requirements.</li> <li>5. The customer clicks on the <b>Continue</b> button, proceeds to the <b>Payment</b> page and clicks on the <b>Place order</b> button.</li> <li>6. A call to Forter is sent, the transaction is approved and the thank you page is successfully loaded.</li> <li>7. When the merchant navigates to Merchant Tools &gt; Forter&gt; Order, searches for the placed order and inspects the Forter Decision column it will be seen that the Forter Decision is <i>Approved</i> and the order status is <i>New</i>. <ul style="list-style-type: none"> <li>• Note that a similar flow can be done for guest checkout</li> </ul> </li> </ol>

UC - 2	Registered Customer: Declined Order Status Validation
<p>This use case describes the high level steps in which a registered customer creates an order and the Forter decides to Decline the order.</p>	<ol style="list-style-type: none"> <li>1. The customer creates an account and logs in with the newly created account using email <i>decline@forter.com</i>.</li> <li>2. The customer selects an item, adds it to the cart and proceeds to the cart page.</li> <li>3. The customer clicks on the <b>Checkout</b> button and fills out the shipping form requirements.</li> <li>4. The customer clicks on the <b>Continue</b> button and proceeds to fill in the billing form requirements.</li> <li>5. The customer clicks on the <b>Continue</b> button, proceeds to the <b>Payment</b> page and clicks on the <b>Place order</b> button.</li> <li>6. A call to Forter is sent, <i>the transaction is declined and based on the Forter configuration a declined message may be displayed</i>.</li> <li>7. When the merchant navigates to Merchant Tools &gt; Forter&gt; Order, searches for the placed order and inspects the Forter Decision column it will be seen that the Forter Decision is <i>Declined</i> and the order status is <i>Failed</i>. <ul style="list-style-type: none"> <li>• Note that a similar flow can be done for guest checkout.</li> </ul> </li> </ol>

UC - 3	Guest Customer: Failed Order Status Validation
<p>This use case describes the high level steps in which a guest customer creates an order but the status order validation is Failed.</p>	<ol style="list-style-type: none"> <li>1. The customer selects an item, adds it to the cart and proceeds to the cart page.</li> <li>2. The customer clicks on the <b>Checkout</b> button &gt; <b>Checkout as Guest</b> and fills out the shipping form requirements.</li> <li>3. The customer clicks on the <b>Continue</b> button and proceeds to fill in the billing form requirements using an expired credit card.</li> <li>4. The customer clicks on the <b>Continue</b> button, proceeds to the <b>Payment</b> page and clicks on the <b>Place order</b> button.</li> <li>5. The payment gateway fails the order.</li> <li>6. <i>The call to Forter is not sent, the transaction is not approved and the Salesforce Commerce Cloud standard failed message is displayed.</i></li> <li>7. When the merchant navigates to Merchant Tools &gt; Forter&gt; Order, searches for the placed order and inspects the Forter Decision column it will be seen that the Forter Decision is <i>Not sent</i> and the order status is <i>Failed</i>. <ul style="list-style-type: none"> <li>• Note that a similar flow can be done for a registered user checkout.</li> </ul> </li> </ol>

UC - 4	Registered Customer: Login data, Payment data & Address data sent to Forter for Validation
<p>This use case describes the high level steps in which a customer successfully creates an account and modifies the account properties such as addresses, payment information, and wish list items</p>	<ol style="list-style-type: none"> <li>1. The customer creates an account and logs in with the newly created account. à The login details are sent to Forter.</li> <li>2. The customer adds a credit card to the account. à The card details are sent to Forter.</li> <li>3. The customer adds an address to the account. à The address details are sent to Forter.</li> <li>4. The customer adds an item to the wish list. à The updated wish list is sent to Forter.</li> </ol> <p>The latter information is used by Forter to detect fraudulent orders.</p>

UC – 5	Send Forter updated order status information
This use case describes how to change status on orders and send the updated status to Forter	<ol style="list-style-type: none"> <li>1. Create multiple orders via the storefront.</li> <li>2. Navigate to Merchant tools &gt; Forter &gt; Order view. For each order, update the order status to a different value (e.g. Completed, Cancelled).</li> <li>3. Navigate to Administration &gt; Operations &gt; Schedules and run the ForterOrderUpdate job.</li> <li>4. Navigate to Merchant tools &gt; Forter &gt; Order view to confirm the Forter order status has been updated for the relevant orders.</li> </ol>

UC – 6	Guest Customer: Paypal Data Flow
This use case describes how to submit Paypal Express orders to Forter	<ol style="list-style-type: none"> <li>1. The customer selects an item, adds it to the cart and proceeds to the cart page.</li> <li>2. The customer clicks on the <b>Checkout with Paypal</b> button &gt; logs into the relevant Paypal account (e.g. <a href="mailto:approve@forter.com">approve@forter.com</a>), selects the shipping address, and confirms the order</li> <li>3. The customer clicks on the <b>Place Order</b> button.</li> <li>4. A call to Forter is sent, the transaction is approved and the thank you page is successfully loaded.</li> <li>5. When the merchant navigates to Merchant Tools &gt; Forter&gt; Order, searches for the placed order and inspects the Forter Decision column it will be seen that the Forter Decision is <i>Approved</i> and the order status is <i>New</i>. <ul style="list-style-type: none"> <li>• Note that a similar flow can be done for a declined transaction.</li> </ul> </li> </ol>

UC - 7	Customer Login
<p>This use case describes the possible forter response and decisions for account login event.</p>	<ol style="list-style-type: none"> <li>1. A user accesses the Login page and logs in.</li> <li>2. Information is sent to Forter.</li> <li>3. Forter's response has the attribute forterDecision with possible values: APPROVED, DECLINED, NOT_REVIEWED, VERIFICATION_REQUIRED</li> <li>4. Merchant can use this attribute to take action (It's up to the merchant to decide what action he wants to take).</li> <li>5. Custom code can be written and executed after the service response to do their desired action, examples: <ol style="list-style-type: none"> <li>a. In case of "VERIFICATION_REQUIRED", the merchant can use a MFA/OPT of their choice and send the result by using the Authentication Attempt API, this is implemented in the cartridge's code but must be customized, see pages 27 for SiteGenesis implementation and page 31 for SFRA implementation.</li> <li>b. In case of "DECLINED", the merchant can decide to deny the login from the customer.</li> <li>c. In case of "NOT_REVIEWED", the merchant can allow the login or review on their own.</li> <li>d. In case of "APPROVED", the merchant can allow the login.</li> </ol> </li> </ol>

UC – 8	Customer updates profile, addresses and payment methods.
<p>This use case describes the possible Forter response and decisions for account events, profile update, addresses and payment methods.</p>	<ol style="list-style-type: none"> <li>1. A user accesses their profile.</li> <li>2. User tries to update their profile, address or payment method.</li> <li>3. Information is sent to Forter</li> <li>4. Forter's response has the attribute <code>forterDecision</code> with possible values: APPROVED, DECLINED, NOT_REVIEWED, VERIFICATION_REQUIRED</li> <li>5. Merchant can use this attribute to take action (It's up to the merchant to decide what action he wants to take)</li> <li>6. Custom code can be written and executed after the service response to do their desired action, examples.               <ol style="list-style-type: none"> <li>a. In case of "VERIFICATION_REQUIRED", it is recommended the merchant verifies the customer's identity first, to allow the changes, and then update Forter on the verification results</li> <li>b. In case of "DECLINED", the merchant can decide to throw an error to the customer.</li> <li>c. In case of "NOT_REVIEWED", the merchant can allow the changes or review it on their own.</li> <li>d. In case of "APPROVED", the merchant can allow the changes.</li> </ol> </li> </ol>

## 2.3 Limitations and Constraints

In order to make use of the Forter cartridge, merchants must have a Forter account. Implementing the cartridge successfully will require the relevant API credentials.

## 2.4 Compatibility

The Forter integration cartridge was certified with the latest version of Salesforce Commerce Cloud (currently API version 21.20, Site Genesis version 105.2.0 and SFRA version 5.3.0). It is typically backward compatible with older versions since it uses common and stable methods accessing the Customer, Order and Payment system objects. Pipelines installations are uncertified and at your own risk.

The cartridge was validated with the out-of-the-box locales on both *RefArch* and *RefArchGlobal* sites with default locale `en_US` but can be used with any locale.

## 2.5 Privacy, Payment

- Forter's order validation call should be executed between payment authorization and payment capture. This positioning is important, because the request to Forter uses the authorization response data. Based on the configuration, the payment capture either can or cannot be executed if Forter returns a "decline" decision.
- When the ***Auto-invoice when transaction is approved*** option is checked the payment capture will be executed on approval.
- When a decline response is received, the action taken regarding voiding the payment depends on the merchant's chosen configuration setting. The merchant can opt to void the payment manually or automatically, either immediately.
- Forter complies with and exceeds the requirements of PCI DSS standard level 1, and Forter is PCI Level 1 Certified. Please note that Forter does not collect full PAN and that Forter is committed to the appropriate protection of the parts of Cardholders' Data that it collects; this is achieved by a thorough hardening of the full Cardholders' Data Environment (CDE).

## 3. Implementation Guide

### 3.1 Setup

The following cartridges have been added:

- int\_forter
- int\_forter\_sfra
- bm\_forter

### 3.2 Configuration

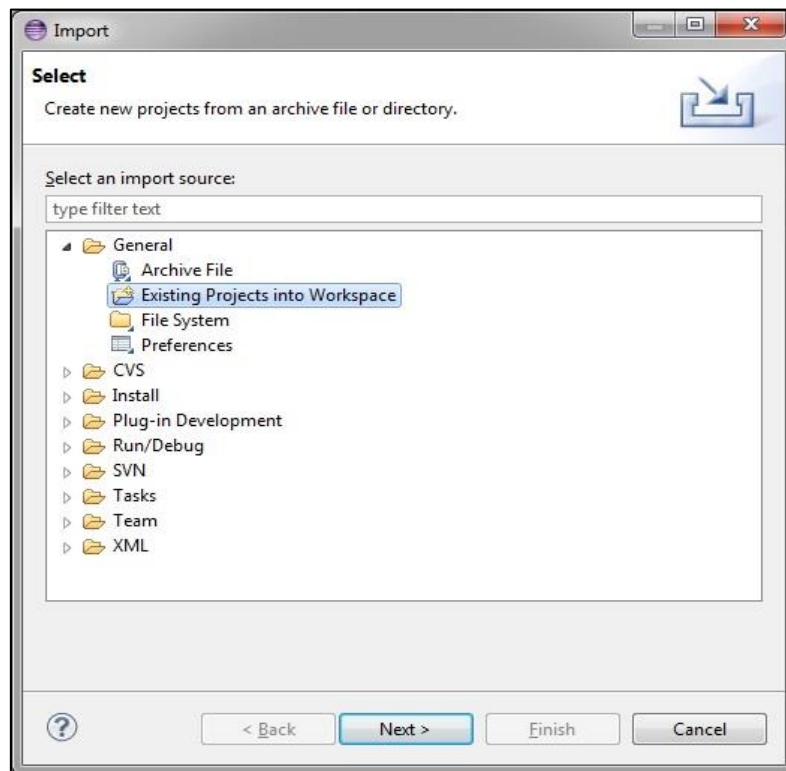

#### 3.2.1 Setup

Importing the Forter cartridges is simple. Follow the steps below in order to import the cartridges:

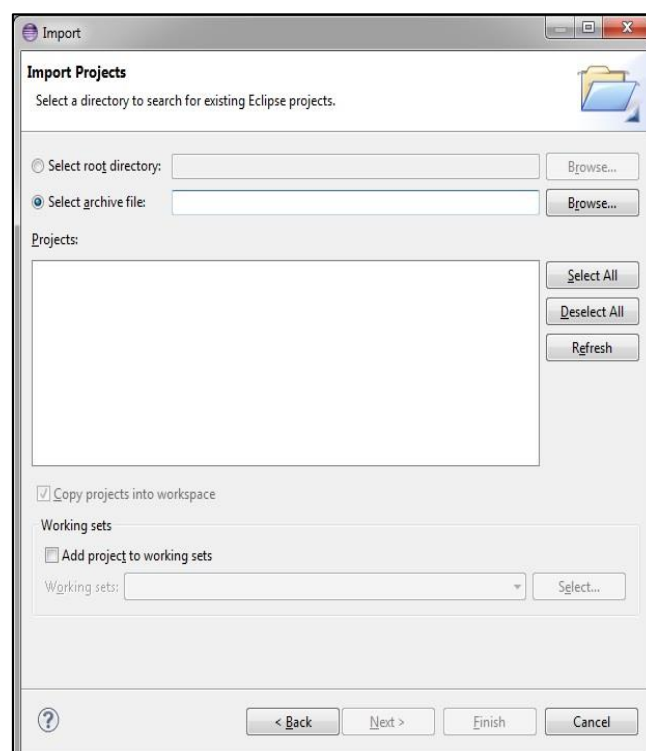

1. Select the connection to the DW server -> Import

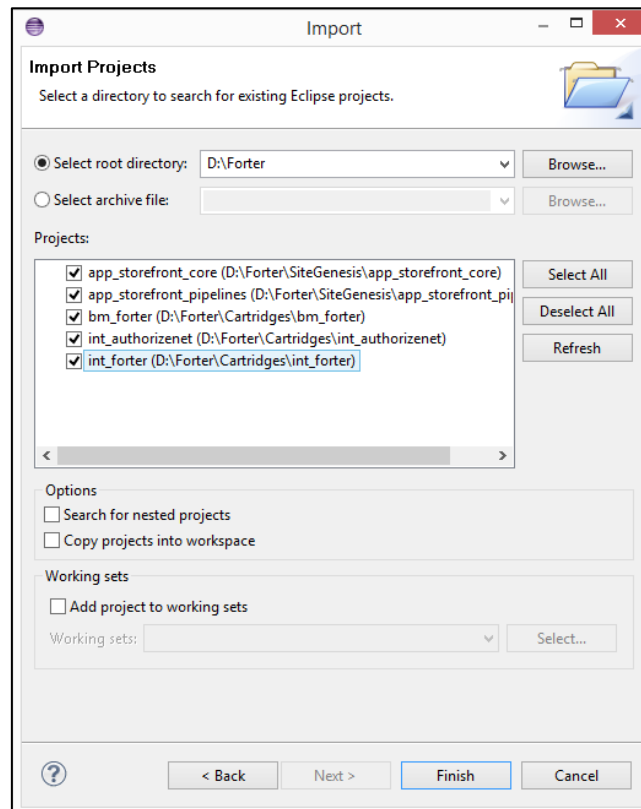

2. Select the “Existing Project into Workspace” option

3. Import Projects -> Select archive file (or “root directory”) if you have already unzipped the cartridge

4. Select the archive from your local source (or the unzipped cartridge)

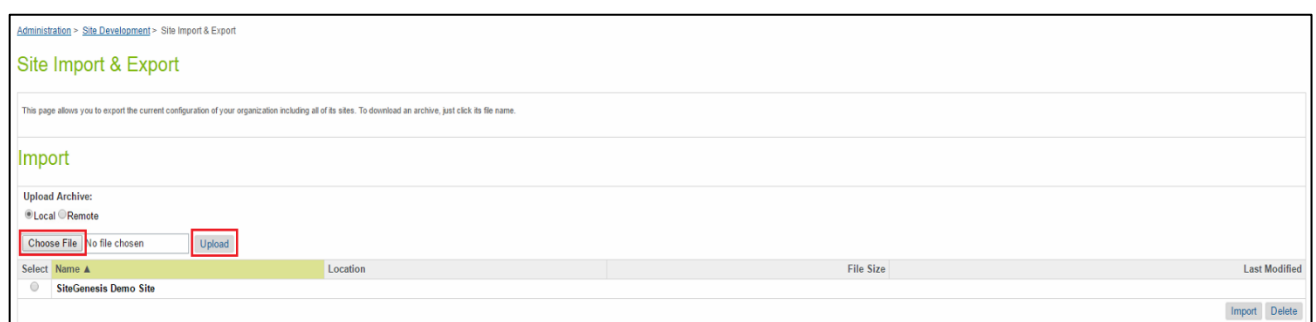

5. Select all, click Finish and then click Yes in order to complete the import and link the cartridge to the DW server.

### 3.2.2 Metadata import

In the Metadata folder you will find a zip file called 'site\_template'.

Go to Administration > Site development > Site Import & Export and upload the zip file.

Select the zip you uploaded, click on Import then on the ok button

Administration > Site Development > Site Import & Export

### Site Import & Export

This page allows you to export the current configuration of your organization including all of its sites. To download an archive, just click its file name.

#### Import

⚠ Are you sure that you want to import the selected archive? OK Cancel

Upload Archive:

☒ Local ☐ Remote

Choose File No file chosen Upload

Select	Name	Location	File Size	Last Modified
<input checked="" type="checkbox"/>	site_template.zip	local	4.10 KB	4/13/16 9:14:30 pm

SiteGenesis Demo Site

Import Delete

### 3.2.3 Cartridge paths

Go to Administration > Sites > Manage Sites and choose your site. Click on the Settings tab, add in the cartridge path int\_forter then click Apply.

Administration > Sites > Manage Sites > SiteGenesis - Settings

General **Settings** Cache Site Status

### SiteGenesis - Settings

Click Apply to save the details. Click Reset to revert to the last saved state.

Instance Type: Sandbox/Development

Deprecated. The preferred way of configuring HTTP and HTTPS hostnames is by using new features of the site aliases configuration ("Site URLs/Aliases Configuration"). The HTTP/HTTPS hostnames values set in this section will be used if no hostnames are defined by aliases configuration and are intended only to support an older configuration style.

HTTP Hostname:

HTTPS Hostname:

Instance Type: All

Cartridges:

Effective Cartridge Path:

Apply Reset

Add in the cartridge path int\_forter\_sfra in case if site is SFRA based.

Administration > Sites > Manage Sites > RefArch - Settings

General **Settings** Cache Site Status Page Meta Tag Rules

### RefArch - Settings

Click Apply to save the details. Click Reset to revert to the last saved state.

Instance Type: Sandbox/Development

Deprecated. The preferred way of configuring HTTP and HTTPS hostnames is by using new features of the site aliases configuration ("SEO > Aliases Configuration"). The HTTP/HTTPS hostname values set in this section will be used if no hostnames are defined by aliases configuration and are intended only to support an older configuration style.

HTTP Hostname:

HTTPS Hostname:

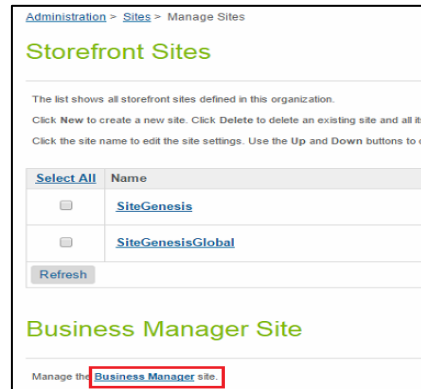

Instance Type: All

Cartridges:

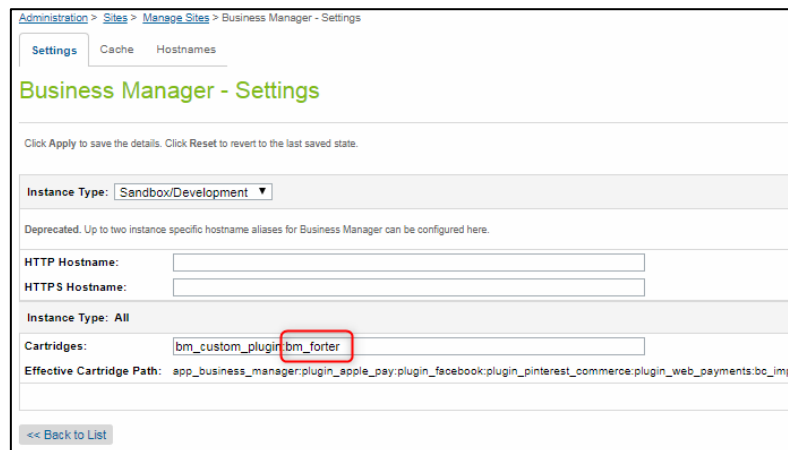

Effective Cartridge Path:

Apply Reset

Go to Administration > Sites > Manage Sites and click on Business Manager link.

Add to the cartridge path bm\_forter then click Apply.

### 3.2.4 Forter custom site preferences

A Site Preferences page is added in Business Manager to give merchant the ability to configure the Forter cartridge settings. This page can be accessed in Site Preferences > Custom Preferences > Forter:

- **Forter enabled** – Indicates whether the Forter code will be executed or not.
- **Show customized message when Forter has returned a decline decision and the order was cancelled immediately** – If enabled, this option means that a decline page (with customizable message) is shown in cases when Forter declines the order. This setting is disabled if **Cancel and void order when transaction is declined** is disabled.
- **Customized message** – If a message is entered and enabled, the message is shown on the decline page.
- **Auto-invoice when transaction is approved** – If enabled, when an “approve” decision is returned the payment gateway capture request is called and the order is placed.
- **Cancel and void order when transaction is declined** – If enabled then when Forter returns a “decline” decision, the order is Failed and a request is made to the payment processor to void the order. If this option is not selected, then in cases of a “decline” decision the order is placed (the order status is New).
- **Number of weeks** – the time range (number of weeks) that the Forter Order Update job queries in order to update order status. The default value is 4 weeks.

Force Forter decision – this preference is used to test customer requests for Forter services, it has five values, Disabled will keep this preference disabled which means the services will receive a normal request, this is the value to use on production. Go to Administration > Organization > Roles & Permissions. Choose the Administrator role and click on the Business Manager Modules tab. Select your site from the Select Context section. Select Forter modules and click Apply.

Secret key

\*\*\*\*\*

Save

## 3.3 Custom Code

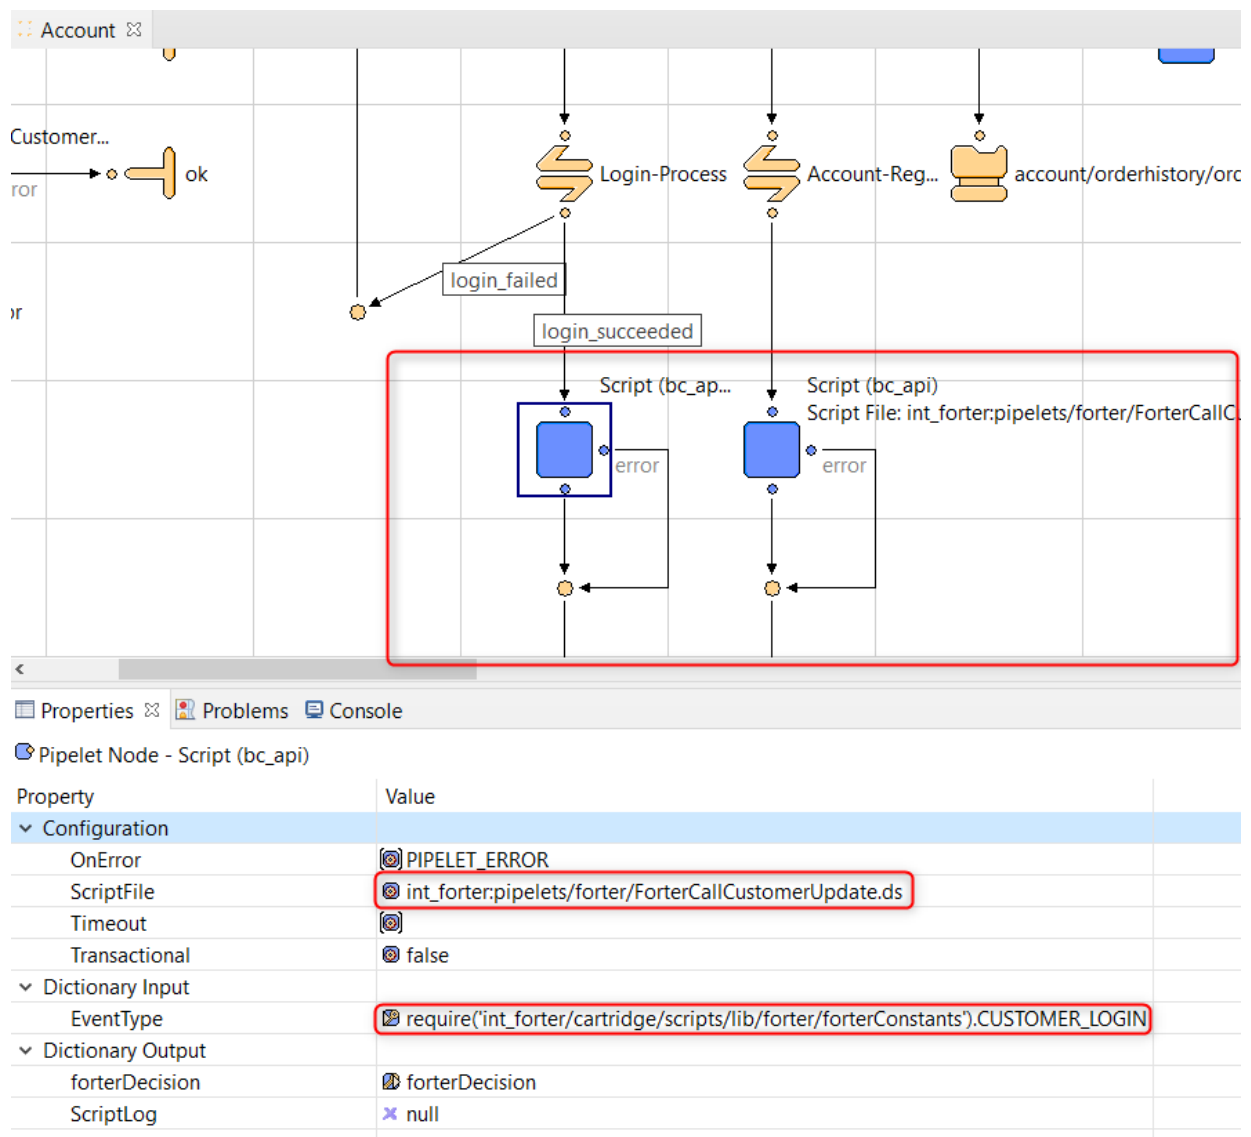

The Forter platform allows for custom attributes to be sent in the request. It is recommended that if you have attributes that are relevant for fraud detection, you should set them in the request objects generated in the cartridge.

### 3.3.1 Pipelines

In order to integrate the cartridge with Site Genesis based on pipelines, the pipelets/forter/ForterCallCustomerUpdate.ds has to be added to the following pipelines, each using its own eventType as input:

- Account-RequireLogin,

EventType require('int\_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER\_LOGIN

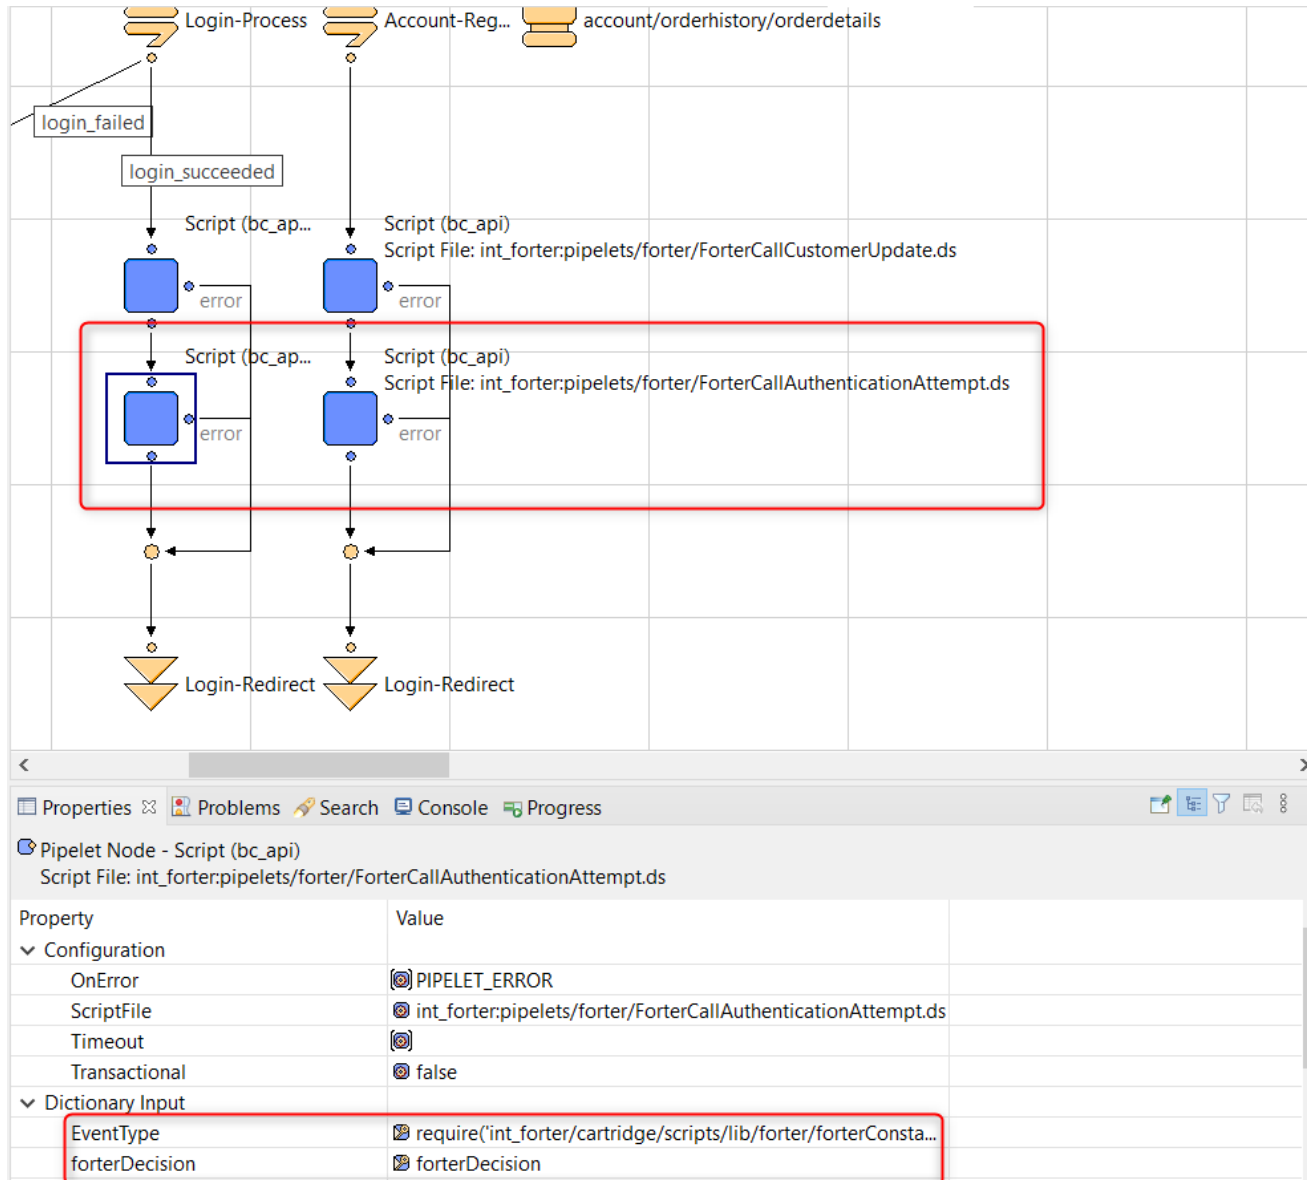

To call the authentication attempt service you'll need to add the following pipelet after the call to process the login

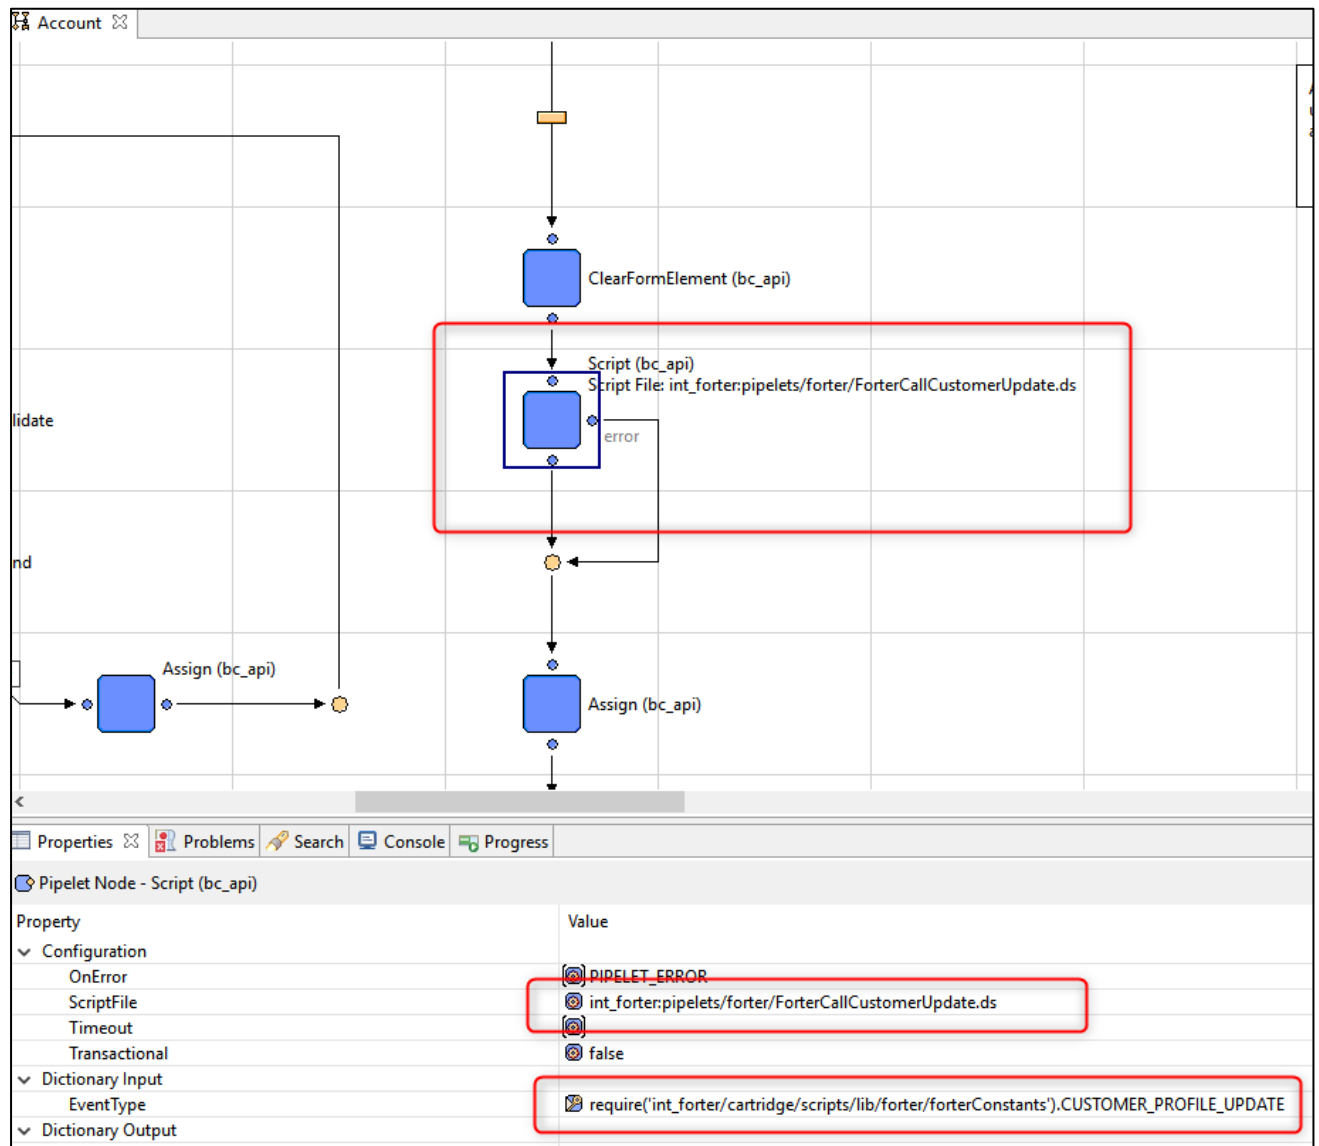

EventType require('int\_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER\_LOGIN

forterDecision is the Forter's response from the login call.

- Account-EditProfile,

EventType require('int\_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER\_PROFILE\_UPDATE

- ```
EventType require('int_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_CREATE
```

- Address-List, EventType

`require('int_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_ADDRESS_UPDATE`

The screenshot displays a Forter pipeline editor. The main canvas shows a flow starting with 'UpdatePageMetaData (bc\_api)', followed by a 'Script (bc\_api)' node (highlighted with a red box). The script file is 'int\_forter:pipelets/forter/ForterCallCustomerUpdate.ds'. An 'error' output from the script points to a connector leading to 'account/addressbook/addresslist'. Another path from the script node goes to a connector leading to 'account/'. This path then splits into 'cancel' and 'create' actions, each followed by a 'CSRF-Validate' node. A 'ClearForter' node is also visible at the top right.

Below the canvas is a 'Properties' panel for the 'Pipelet Node - Script (bc\_api)'. The script file is 'int\_forter:pipelets/forter/ForterCallCustomerUpdate.ds'. The properties are as follows:

| Property          | Value                                                                                      |
|-------------------|--------------------------------------------------------------------------------------------|
| Configuration     |                                                                                            |
| OnError           | PIPELET_ERROR                                                                              |
| ScriptFile        | int_forter:pipelets/forter/ForterCallCustomerUpdate.ds                                     |
| Timeout           |                                                                                            |
| Transactional     | false                                                                                      |
| Dictionary Input  |                                                                                            |

- PaymentInstruments-List, EventType  
require('int\_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER\_PAYMENT\_UPDATE

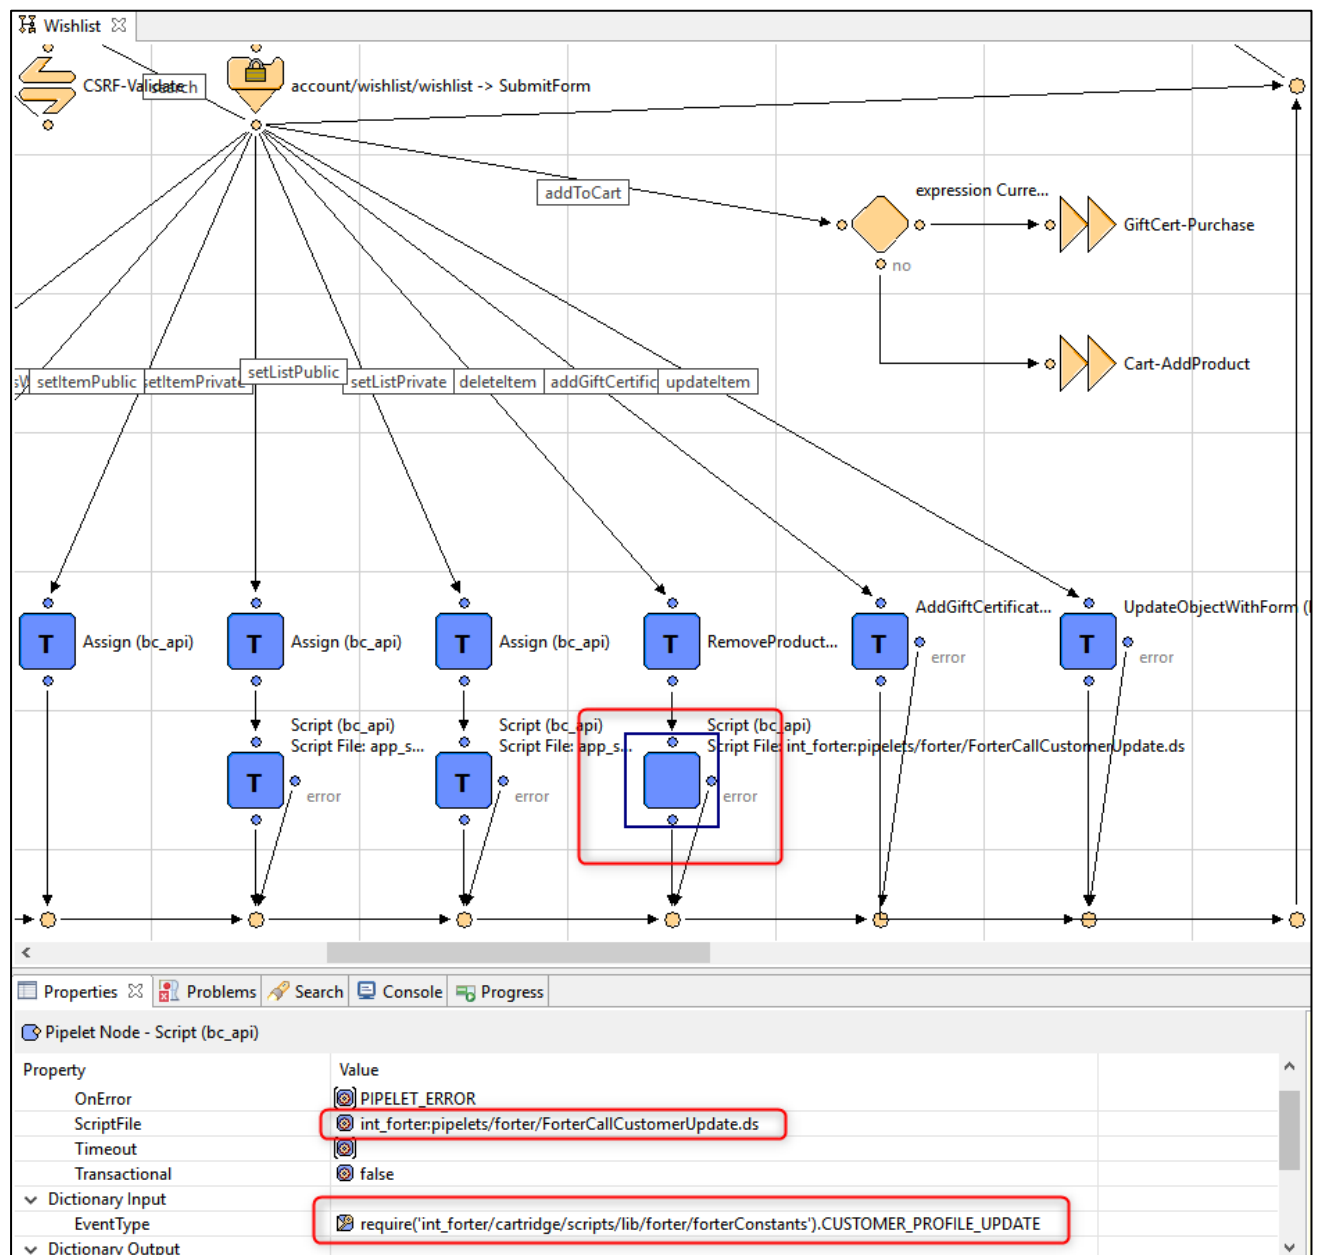

- Wishlist-Add, EventType

`require('int_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE`

- Wishlist-Show (in the 'deleteItem' transition), EventType  
require('int\_forter/cartridge/scripts/lib/forter/forterConstants').CUSTOMER\_PROFILE\_UPDATE

### 3.3.2 Controllers

In order to integrate the cartridge with Site Genesis based on controllers, the pipelets/forter/ForterCustomerUpdate.js has to be added to the following controllers:

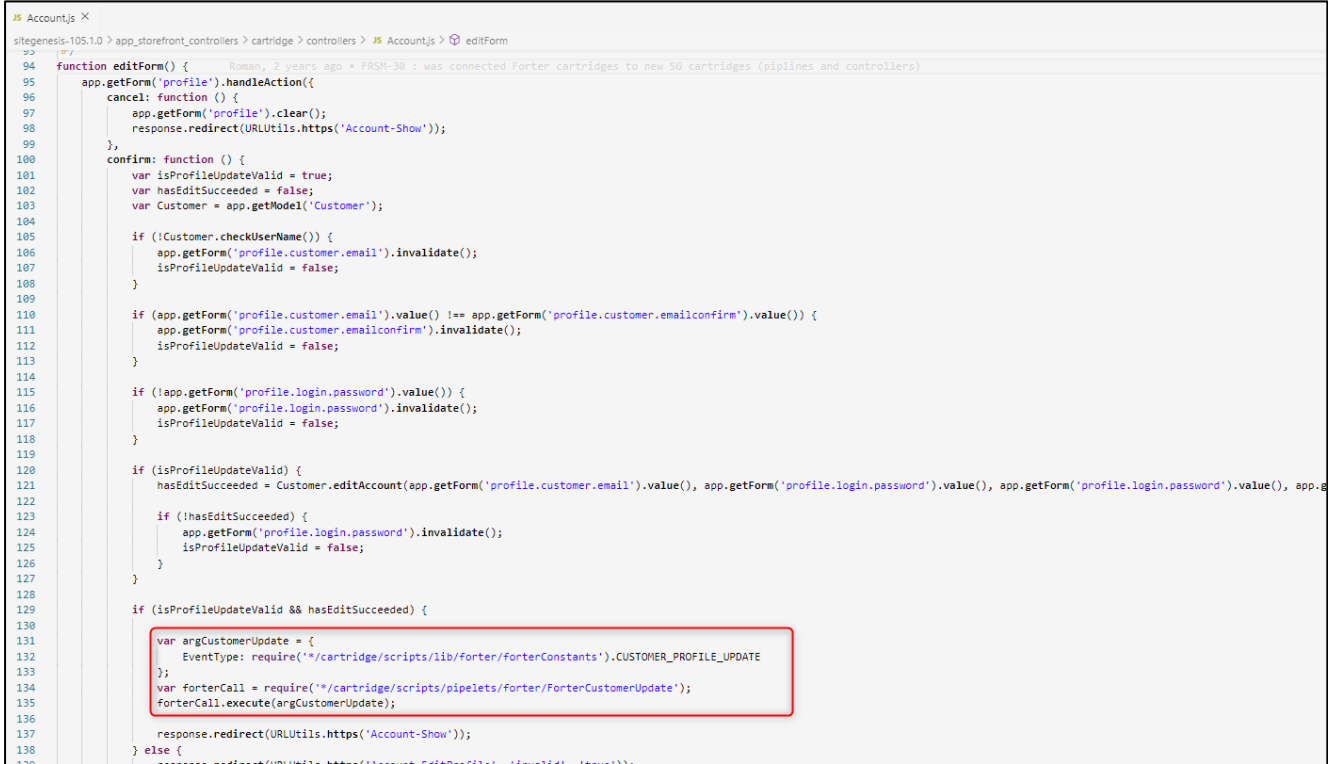

- Account.js (in the editForm() function):

```
var argCustomerUpdate = {
```

```
  EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE};
```

```
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
```

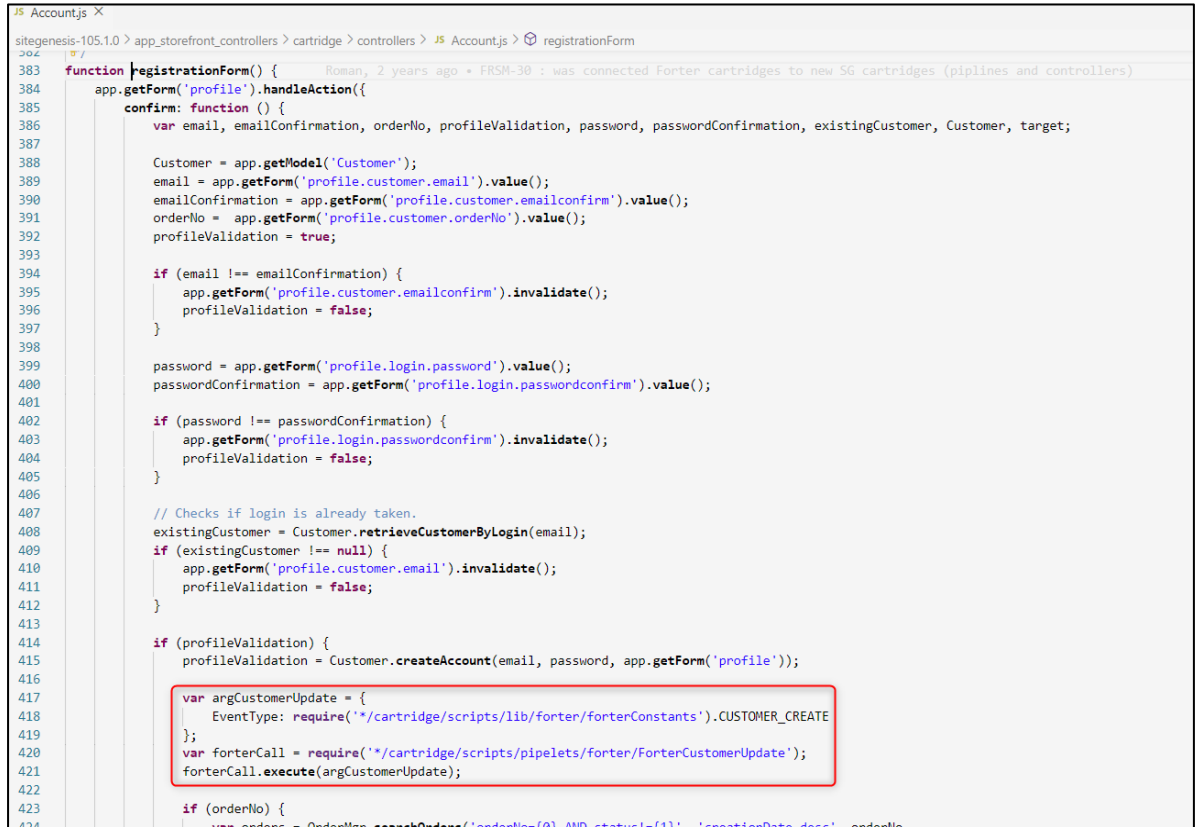

```
forterCall.execute(argCustomerUpdate);
```

```
94 function editForm() {
95   app.getForm('profile').handleAction({
96     cancel: function () {
97       app.getForm('profile').clear();
98       response.redirect(URLUtils.https('Account-Show'));
99     },
100    confirm: function () {
101      var isProfileUpdateValid = true;
102      var hasEditSucceeded = false;
103      var Customer = app.getModel('Customer');
104
105      if (!Customer.checkUserName()) {
106        app.getForm('profile.customer.email').invalidate();
107        isProfileUpdateValid = false;
108      }
109
110      if (app.getForm('profile.customer.email').value() !== app.getForm('profile.customer.emailconfirm').value()) {
111        app.getForm('profile.customer.emailconfirm').invalidate();
112        isProfileUpdateValid = false;
113      }
114
115      if (!app.getForm('profile.login.password').value()) {
116        app.getForm('profile.login.password').invalidate();
117        isProfileUpdateValid = false;
118      }
119
120      if (isProfileUpdateValid) {
121        hasEditSucceeded = Customer.editAccount(app.getForm('profile.customer.email').value(), app.getForm('profile.login.password').value(), app.getForm('profile.login.password').value(), app.getForm('profile.login.password').value());
122
123        if (!hasEditSucceeded) {
124          app.getForm('profile.login.password').invalidate();
125          isProfileUpdateValid = false;
126        }
127      }
128
129      if (isProfileUpdateValid && hasEditSucceeded) {
130        var argCustomerUpdate = {
131          EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE
132        };
133        var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
134        forterCall.execute(argCustomerUpdate);
135
136        response.redirect(URLUtils.https('Account-Show'));
137      } else {
138        response.redirect(URLUtils.https('Account-EditProfile?isvalid=false'));
139      }
140    }
141  });
142}
```

- Account.js ( in the registrationForm() function):

```
var argCustomerUpdate = {
  EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_CREATE};
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
forterCall.execute(argCustomerUpdate);
```

```

383 function registrationForm() {
384   app.getForm('profile').handleAction({
385     confirm: function () {
386       var email, emailConfirmation, orderNo, profileValidation, password, passwordConfirmation, existingCustomer, Customer, target;
387
388       Customer = app.getModel('Customer');
389       email = app.getForm('profile.customer.email').value();
390       emailConfirmation = app.getForm('profile.customer.emailconfirm').value();
391       orderNo = app.getForm('profile.customer.orderNo').value();
392       profileValidation = true;
393
394       if (email !== emailConfirmation) {
395         app.getForm('profile.customer.emailconfirm').invalidate();
396         profileValidation = false;
397       }
398
399       password = app.getForm('profile.login.password').value();
400       passwordConfirmation = app.getForm('profile.login.passwordconfirm').value();
401
402       if (password !== passwordConfirmation) {
403         app.getForm('profile.login.passwordconfirm').invalidate();
404         profileValidation = false;
405       }
406
407       // Checks if login is already taken.
408       existingCustomer = Customer.retrieveCustomerByLogin(email);
409       if (existingCustomer !== null) {
410         app.getForm('profile.customer.email').invalidate();
411         profileValidation = false;
412       }
413
414       if (profileValidation) {
415         profileValidation = Customer.createAccount(email, password, app.getForm('profile'));
416
417         var argCustomerUpdate = {
418           EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_CREATE
419         };
420         var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
421         forterCall.execute(argCustomerUpdate);
422
423       if (orderNo) {

```

- Address.js (in the list() function):

```
var argCustomerUpdate = {
  EventType:
  require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_ADDRESS_UPDATE};
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
forterCall.execute(argCustomerUpdate);
```

```

21 */
22 function list() {
23   var pageMeta = require('~/cartridge/scripts/meta');
24
25   var content = app.getModel('Content').get('myaccount-addresses');
26   if (content) {
27     pageMeta.update(content.object);
28   }
29
30   var argCustomerUpdate = {
31     EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE
32   };
33   var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
34   forterCall.execute(argCustomerUpdate);
35
36   app.getView().render('account/addressbook/addresslist');
37 }

```

- Login.js (in the handleLoginForm() function):

```
var forterConstants = require('*/cartridge/scripts/lib/forter/forterConstants');
```

```
var argCustomerUpdate = {  
  EventType: forterConstants.CUSTOMER_LOGIN  
};
```

```
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');  
var forterDecision = forterCall.execute(argCustomerUpdate);
```

*You only need to include this call for the authentication attempt API, if you have an advanced authentication method used for MFA or OTP, in this case you'll need to provide the information returned from your MFA in this request.*

```
if (forterDecision == forterConstants.STATUS_VERIFICATION_REQ) {  
  var argAuthenticationAttemptUpdate = {  
    EventType: forterConstants.CUSTOMER_AUTH_ATTEMPT  
  };  
  
  // example of object with MFA results  
  argAuthenticationAttemptUpdate.additionalAuthenticationMethod = {  
    verificationOutcome: '<Your MFA outcome result>',  
    correlationId: '<result from MFA>',  
    emailVerification: {  
      email: customer.profile.email,  
      emailRole: 'ACCOUNT',  
      sent: true,  
      verified: true  
    }  
  };  
  var forterAuthAttempCall = require('*/cartridge/scripts/pipelets/forter/ForterAuthenticationAttemptUpdate');  
  forterAuthAttempCall.execute(argAuthenticationAttemptUpdate);  
}
```

```

JS Login.js
sitegenesis-105.1.0 > app_storefront_controllers > cartridge > controllers > JS Login.js > handleLoginForm
96 loginForm.handleAction({

120     var forterResult = forterCall.execute(argCustomerUpdate);
121
122     if (forterResult.forterDecision === forterConstants.STATUS_VERIFICATION_REQ) {
123       var argAuthenticationAttemptUpdate = {
124         EventType: forterConstants.CUSTOMER_AUTH_ATTEMPT
125       };
126
127       // example of object populated with MFA results.
128       argAuthenticationAttemptUpdate.additionalAuthenticationMethod = {
129         verificationOutcome: 'SUCCESS',
130         correlationId: 'HG37512345H3DE',
131         emailVerification: {
132           email: customer.profile.email,
133           emailRole: 'ACCOUNT',
134           sent: true,
135           verified: true,
136         }
137       };
138
139       var forterAuthAttemptCall = require('*/cartridge/scripts/pipelets/forter/ForterAuthenticationAttemptUpdate');
140       forterAuthAttemptCall.execute(argAuthenticationAttemptUpdate);
141     }
142   }
143 }

```

- Paymentinstruments.js (in the list() function):

```

var argCustomerUpdate = {
  EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PAYMENT_UPDATE};
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
forterCall.execute(argCustomerUpdate);

```

```

JS PaymentInstruments.js
sitegenesis-105.1.0 > app_storefront_controllers > cartridge > controllers > JS PaymentInstruments.js > list
28 customer (account/payment/paymentinstrumentlist template).
29 */
30 function list() {
31   var wallet = customer.getProfile().getWallet();
32   var paymentInstruments = wallet.getPaymentInstruments(dw.order.PaymentInstrument.METHOD_CREDIT_CARD);
33   (local var) paymentForm: any @/scripts/meta';
34   var paymentForm = app.getForm('paymentinstruments');
35
36   paymentForm.clear();
37   paymentForm.get('creditcards.storedcards').copyFrom(paymentInstruments);
38
39   pageMeta.update(dw.content.ContentMgr.getContent('myaccount-paymentsettings'));
40
41   var argCustomerUpdate = {
42     EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE
43   };
44   var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
45   forterCall.execute(argCustomerUpdate);
46
47   app.getView({
48     PaymentInstruments: paymentInstruments
49   }).render('account/payment/paymentinstrumentlist');
50 }

```

- Wishlist.js ( in the add() function):

```

var argCustomerUpdate = {
  EventType:
    require('*/cartridge/scripts/lib/forter/ForterConfig.ds').ForterConfig.CUSTOMER_PROFILE_UPDATE};

```

```
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');  
forterCall.execute(argCustomerUpdate);
```

The screenshot shows a code editor with a file named 'Wishlist.js'. The breadcrumb navigation indicates the path: 'sitegenesis-105.1.0 > app\_storefront\_controllers > cartridge > controllers > JS Wishlist.js > add > argCustomerUpdate > EventType'. The code is as follows:

```
223 function add() {  
224     addProduct();  
225  
226     var argCustomerUpdate = {  
227         EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE  
228     };  
229     var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');  
230     forterCall.execute(argCustomerUpdate);  
231  
232     response.redirect(dw.web.URLUtils.https('Wishlist-Show'));  
233 }  
234  
235 function search () {  
236     app.getForm('wishlist.search').clear();  
237     app.getView({  
238         ContinueURL: URLUtils.https('Wishlist-WishListForm')  
239     }).render('account/wishlist/wishlistresults');  
240 }  
241
```

A red rectangular box highlights the code block for `argCustomerUpdate` on lines 226 through 230.

- Wishlist.js (in the wishListForm() function):

```
var argCustomerUpdate = {
  EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE };
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
forterCall.execute(argCustomerUpdate);
```

```

67 function wishListForm() {
68   var productList = app.getModel('ProductList').get();
69   var shouldRedirectToShow = true;
70
71   app.getForm(request.triggeredForm.formId).handleAction({
72     addGiftCertificate: function () {
73       Transaction.wrap(function () {
74         productList.createGiftCertificateItem();
75       });
76     },
77     deleteItem: function (formgroup, action) {
78       var sessionCustomer = session.customer;
79       if (sessionCustomer.ID === action.object.list.owner.ID) {
80         productList.removeItem(action.object);
81         var argCustomerUpdate = {
82           EventType: require('*/cartridge/scripts/lib/forter/forterConstants').CUSTOMER_PROFILE_UPDATE
83         };
84         var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
85         forterCall.execute(argCustomerUpdate);
86       }
87     },
88     updateItem: function (formgroup, action) {
89       var sessionCustomer = session.customer;
90       if (sessionCustomer.ID === action.object.list.owner.ID) {
91         app.getForm(action.parent).copyTo(action.object);
92       }
93     },
94     setListPrivate: function () {
95       // No need to check for productList ownership at this point because the productList
96       // retrieved from the shopper's profile and in the currently implementation the shopper
97       // can only have on productList of type TYPE_WISH_LIST
98       productList.setPublic(false);
99     }
100   });
  
```

- ForterOrder.js (SG) and forterOrder.js(SFRA)

In the ForterPayment function we need to add back this piece of code

```
this.billingDetails.personalDetails.email = order.customerEmail;
this.billingDetails.address = {};
this.billingDetails.address.address1 = billingAddress.address1;
this.billingDetails.address.address2 = !empty(billingAddress.address2) ? billingAddress.address2 : "";
this.billingDetails.address.zip = billingAddress.postalCode;
this.billingDetails.address.city = billingAddress.city;
this.billingDetails.address.region = billingAddress.stateCode;
this.billingDetails.address.country = billingAddress.countryCode.value;
```

```

function ForterPayment(order, authResponse, payment, log) {
    var billingAddress = order.billingAddress;

    this.billingDetails = {};
    this.billingDetails.personalDetails = {};
    this.billingDetails.personalDetails.firstName = billingAddress.firstName;
    this.billingDetails.personalDetails.lastName = billingAddress.lastName;
    this.billingDetails.personalDetails.email = order.customerEmail;

    this.billingDetails.address = {};
    this.billingDetails.address.address1 = billingAddress.address1;
    this.billingDetails.address.address2 = !empty(billingAddress.address2) ? billingAddress.address2 : '';
    this.billingDetails.address.zip = billingAddress.postalCode;
    this.billingDetails.address.city = billingAddress.city;
    this.billingDetails.address.region = billingAddress.stateCode;
    this.billingDetails.address.country = billingAddress.countryCode.value;

    if (!empty(billingAddress.phone)) {
        this.billingDetails.phone = [];
        this.billingDetails.phone.push(new ForterPhone(billingAddress.phone));
    }

    this.amount = {
        amountLocalCurrency: order.totalGrossPrice.value.toFixed(2),
        currency: order.totalGrossPrice.currencyCode
    };
}

```

- ForterOrder.js (SG) and forterOrder.js(SFRA)

For the current API version (2.88) in the function ForterPhone need to remove the smsVerified object and the function need to be like this:

code to be removed:

```

this.smsVerified = {
    sent: false,
    verified: false
};

```

```

function ForterPhone(phone) {
    this.phone = phone;
}

```

- forterConstants.js (both SG and SFRA)

Change the value for CUSTOMER\_LOGOUT from login to logout

```

module.exports = {
  STATUS_APPROVED: 'APPROVED',
  STATUS_DECLINED: 'DECLINED',
  STATUS_NOT_REVIEWED: 'NOT_REVIEWED',
  STATUS_VERIFICATION_REQ: 'VERIFICATION_REQUIRED',
  STATUS_ORDER_APPROVE: 'APPROVE',
  STATUS_ORDER_DECLINE: 'DECLINE',
  STATUS_FAILED: 'FAILED',
  STATUS_NOT_SENT: 'NOT_SENT',
  CUSTOMER_LOGIN: 'login',
  CUSTOMER_LOGOUT: 'logout',
  CUSTOMER_CREATE: 'signup',
  CUSTOMER_PROFILE_UPDATE: 'update',
  CUSTOMER_PROFILE_ACCESS: 'profile-access',
  CUSTOMER_AUTH_RESULT: 'authentication-result',
  CUSTOMER_AUTH_ATTEMPT: 'authentication-attempt',
  PHONE_TYPE_PRIMARY: 'Primary',
  PHONE_TYPE_SECONDARY: 'Secondary',
  PHONE_DESC_HOME: 'Home',
  PHONE_DESC_WORK: 'Work',
  PHONE_DESC_MOBILE: 'Mobile',
  ORDER_VALIDATES: 'validates'
};

```

- ForterValidate.js

Add a new functionality for new JavaScript Snippet from which the form can be taken directly from script and not taken from the session via cookie.

```

function updateForterInfo() {
  if (!empty(request.httpParameterMap.ftrToken) && !empty(request.httpParameterMap.ftrToken.value)) {
    session.privacy.ftrToken = request.httpParameterMap.ftrToken.value;
  }
  let r = require('bm_forter/cartridge/scripts/util/Response.js');
  r.renderJSON({
    success: true
  });
  return;
}

```

```

function updateForterInfo() {
  if (!empty(request.httpParameterMap.ftrToken) && !empty(request.httpParameterMap.ftrToken.value)) {
    session.privacy.ftrToken = request.httpParameterMap.ftrToken.value;
  }
  let r = require('bm_forter/cartridge/scripts/util/Response.js');
  r.renderJSON({
    success: true
  });
  return;
}

```

### 3.3.3 SFRA

This section describes integration of the cartridge with site based on SFRA structure and provides a list of all affected controllers. Integration of the cartridge into storefront application does not imply modifications of the core cartridge, SFRA approach of files overwriting should be used instead. In case if storefront application

has same controllers or templates extended or replaced – all mentioned code modifications must be added to the top level cartridge of the storefront application.

- Account.js (prepends the 'Login' with next code include):

```
var forterConstants = require('*/cartridge/scripts/lib/forter/forterConstants');
var argCustomerUpdate = {
  EventType: forterConstants.CUSTOMER_LOGIN,
  customer: customer,
  request: request
};
var forterCall = require('*/cartridge/scripts/pipelets/forter/ForterCustomerUpdate');
var forterDecision = forterCall.execute(argCustomerUpdate);
```

*You only need to include this call for the authentication attempt API, if you have an advanced authentication method used for MFA or OTP, in this case you'll need to provide the information returned from your MFA in this request.*

```
if (forterDecision == forterConstants.STATUS_VERIFICATION_REQ) {
  var argAuthenticationAttemptUpdate = {
    EventType: forterConstants.CUSTOMER_AUTH_ATTEMPT
  };

  // example of object with MFA results
  argAuthenticationAttemptUpdate.additionalAuthenticationMethod = {
    verificationOutcome: '<Your MFA outcome result>',
    correlationId: '<result from MFA>',
    emailVerification: {
      email: customer.profile.email,
      emailRole: 'ACCOUNT',
      sent: true,
      verified: true
    }
  };
  var forterAuthAttempCall = require('*/cartridge/scripts/pipelets/forter/ForterAuthenticationAttemptUpdate');
  forterAuthAttempCall.execute(argAuthenticationAttemptUpdate);
}
```

```

JS Account.js X

- CheckoutServices.js (prepends the 'PlaceOrder' with next code includes) in order to handle the customized error message configured in Forter business manager extension:

```
if (sitePrefs.forterShowDeclinedPage === true && sitePrefs.forterCustomDeclineMessage) {  
  res.json({  
    error: true,  
    errorMessage: sitePrefs.forterCustomDeclineMessage  
  });  
}
```

The screenshot shows a code editor window titled 'CheckoutServices.js'. The code is as follows:

```
170  
171 // Handles payment authorization  
172 var handlePaymentResult = COHelpers.handlePayments(order, order.orderNo);  
173 if (handlePaymentResult.error) {  
174   if (sitePrefs.forterShowDeclinedPage === true && sitePrefs.forterCustomDeclineMessage) {  
175     res.json({  
176       error: true,  
177       errorMessage: sitePrefs.forterCustomDeclineMessage  
178     });  
179   } else {  
180     res.json({  
181       error: true,  
182       errorMessage: Resource.msg('error.technical', 'checkout', null)  
183     });  
184   }  
185  
186   this.emit('route:Complete', req, res);  
187   return;  
188 }  
189  
190 var fraudDetectionStatus = hooksHelper('app.fraud.detection', 'fraudDetection', currentBasket, require('*/cartridge/)  
191 if (fraudDetectionStatus.status === 'fail') {  
192   Transaction.wrap(function () { OrderMgr.failOrder(order, true); });  
193  
194   // fraud detection failed  
195   req.session.privacyCache.set('fraudDetectionStatus', true);
```

A red rectangular box highlights the code block between lines 174 and 179, which contains the conditional logic for displaying a custom decline message.

### 3.3.4 *Forter integration in Checkout / Payment Flow*

This section explores what occurs when the ForterValidate order validation controller is implemented using sample implementations with authorize.net and Paypal. A merchant using a different payment processor *should customize this logic to fit the merchant's business needs and the Forter configuration*. It gets the information from a previously executed payment authorization request and current order details. A Forter order validation API call is made and, if successful, a response with the Forter decision is received and saved per order. Based on that decision and the configuration, the following scenarios can be executed:

- Decision "APPROVED" – if **Auto-invoice when transaction is approved** is enabled, then the payment capture amount operation is executed and the order is placed (via the decision node with condition `ForterResponse.JsonResponseOutput.processorAction === 'capture'` in the diagram below). If this option is not enabled, no capture is executed, and the order is just placed in Salesforce Commerce Cloud (via the decision node with condition `ForterResponse.JsonResponseOutput.processorAction === 'skipCapture'`).
- Decision "DECLINED" –
  - If only **Cancel and void order when transaction is declined** is checked, then the order is failed and a request to void the order is made to the processor. In this case **Show decline page when Forter has returned a decline decision and the order was cancelled** is enabled, then the buyer is directed to a decline page with a customized message.
  - If **Cancel and void order when transaction is declined** is not selected, then the buyer will be directed to the "thank you" page and an order will be placed (via the decision node with condition `ForterResponse.JsonResponseOutput.processorAction === 'skipCapture'`).
- Decision "NOT REVIEWED" – by default a "Not Reviewed" decision will be routed to the decision node with condition `ForterResponse.JsonResponseOutput.processorAction === 'notReviewed'`. *In order to customize the behavior for this flow, use the ForterResponse.JsonResponseOutput.processorAction to split it from the "skipCapture" flow and insert the merchant specific logic for a "Not Reviewed" use case.*

This table represents all the possible output values based on the Forter decision and configuration saved from the Forter Business manager extension.

| Forter Decision | Auto-invoice when transaction is approved | Cancel and void order when transaction is declined | ForterResponse.JsonResponseOutput.processorAction |
|-----------------|-------------------------------------------|----------------------------------------------------|---------------------------------------------------|
| APPROVED        | ON                                        | -                                                  | capture                                           |
|                 | OFF                                       | -                                                  | skipCapture                                       |
| DECLINED        | -                                         | ON                                                 | void                                              |
|                 | -                                         | OFF                                                | skipCapture                                       |
| NOT REVIEWED    | -                                         | -                                                  | notReviewed                                       |
|                 | -                                         | -                                                  | notReviewed                                       |

## Additional Flows

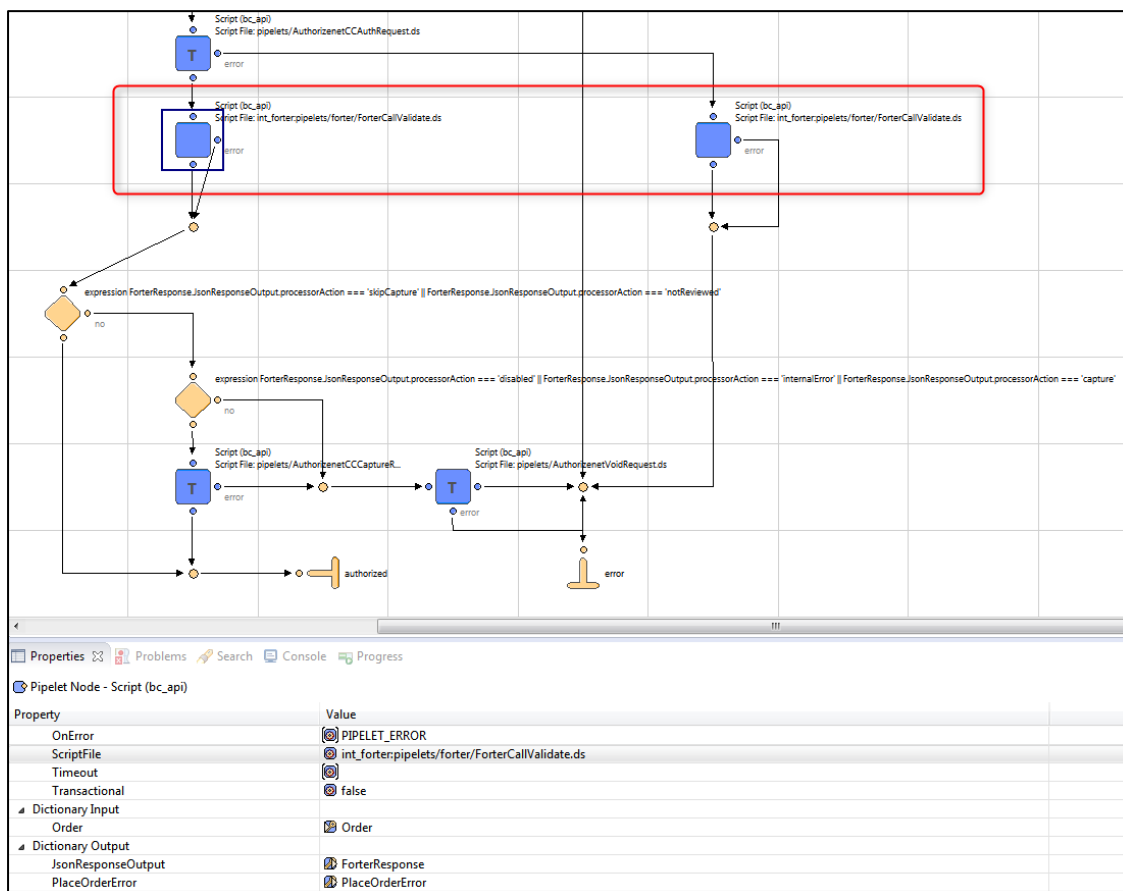

**Payment Gateway error (processor declined authorization)** - Please note in the example authorize.net diagram below, in case the credit card is not authorized by the payment gateway (e.g. expired credit card), the order is still sent to Forter. The request to Forter in this case should get a “NOT REVIEWED” decision (ForterResponse.JsonResponseOutput.processorAction === 'notReviewed') and the user should get routed to a payment error flow. Please note, it's important to verify your processor “authorization declined” codes are properly mapped and sent to Forter via this flow on the sandbox environment before moving to production.

**Forter Cartridge is disabled** - Forter will not return a decision. *The merchant should customize this logic according to his preferences and desired flow without Forter.* In the diagram below, you can see that if the order is sent to ForterCallValidate.ds script node we will route it via the decision node with condition ForterResponse.JsonResponseOutput.processorAction === 'disabled' so the order will be captured and finalized.

**“Internal cartridge ERROR”** – *This should not happen, if it does, please contact Forter customer support. The merchant should customize this logic according to his preferences.* In the example below, the decision node with condition ForterResponse.JsonResponseOutput.processorAction === 'internalError' is configured so the order is still finalized and captured.

## Sample Authorize.net checkout flow (pipelines based)

The diagram below is from the Authorize.net "AUTHORIZE\_NET-Authorize" Pipeline which is triggered as part of the generic Site Genesis authorization flow.

## Sample Authorize.net checkout flow (controllers based)

The code below is from the Authorize.net "AUTHORIZE\_NET-Authorize" controller which is triggered as part of the generic Site Genesis authorization flow.

```
function Authorize(args) {
  if (empty(session.forms.billing.paymentMethods.selectedPaymentMethodID.value)) {
    return {error: true};
  }

  var orderNo          = args.OrderNo,
      paymentInstrument = args.PaymentInstrument,
      paymentProcessor  =
PaymentMgr.getPaymentMethod(paymentInstrument.getPaymentMethod()).getPaymentProcessor();

Transaction.wrap(function () {
  paymentInstrument.paymentTransaction.transactionID = orderNo;
  paymentInstrument.paymentTransaction.paymentProcessor = paymentProcessor;
});

var argCCAuth = {
  Order          : args.Order,
  PaymentInstrument : paymentInstrument
},
authResponse = doAuth(argCCAuth);

if (authResponse.result == false) {
  var argOrderValidate = {
    Order: args.Order,
    orderValidateAttemptInput: 1,
    request: request
  },
  forterController = require('int_forter/cartridge/controllers/ForterValidate'),
  forterDecision  = forterController.ValidateOrder(argOrderValidate);
  // in case if no response from Forter, try to call one more time
  if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
    var argOrderValidate = {
      Order: args.Order,
      orderValidateAttemptInput: 2,
      request: request
    },
    forterController = require('int_forter/cartridge/controllers/ForterValidate'),
    forterDecision  = forterController.ValidateOrder(argOrderValidate);
  }

  if (!empty(forterDecision.PlaceOrderError)) {
    return {error : true, forterErrorCode : forterDecision.PlaceOrderError};
  } else {
    return {error : true};
  }
  return {error: true};
}

if (authResponse.result == true) {
  var argOrderValidate = {
    Order: args.Order,
    orderValidateAttemptInput: 1,
    request: request
  },
  forterController = require('int_forter/cartridge/controllers/ForterValidate'),
  forterDecision  = forterController.ValidateOrder(argOrderValidate);
  // in case if no response from Forter, try to call one more time
  if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
    var argOrderValidate = {
      Order: args.Order,
      orderValidateAttemptInput: 2,
      request: request
    },
    forterController = require('int_forter/cartridge/controllers/ForterValidate'),
    forterDecision  = forterController.ValidateOrder(argOrderValidate);
  }

  if (forterDecision.JsonResponseOutput.processorAction === 'skipCapture' ||
forterDecision.JsonResponseOutput.processorAction === 'notReviewed') {
    return {authorized: true};
  }
}
```

```

    } else if (forterDecision.JsonResponseOutput.processorAction === 'disabled' ||
forterDecision.JsonResponseOutput.processorAction === 'internalError' ||
forterDecision.JsonResponseOutput.processorAction === 'capture') {
    var argCCCapture = {
        AuthorizeNetResponse : authResponse.AuthorizeNetResponse,
        Order : args.Order,
        PaymentInstrument : paymentInstrument
    },
    captureResponse = doCapture(argCCCapture);

    if (captureResponse.result == true) {
        return {authorized: true};
    }

    if (captureResponse.result == false) {
        var argVoid = {
            AuthorizeNetResponse : authResponse.AuthorizeNetResponse,
            Order : args.Order,
            PaymentInstrument : paymentInstrument
        },
        voidResponse = doVoid(argVoid);

        if (!empty(forterDecision.PlaceOrderError)) {
            return {error : true, forterErrorCode : forterDecision.PlaceOrderError};
        } else {
            return {error : true};
        }
    }
} else {
    var argVoid = {
        AuthorizeNetResponse : authResponse.AuthorizeNetResponse,
        Order : args.Order,
        PaymentInstrument : paymentInstrument
    },
    voidResponse = doVoid(argVoid);

    if (!empty(forterDecision.PlaceOrderError)) {
        return {error : true, forterErrorCode : forterDecision.PlaceOrderError};
    } else {
        return {error : true};
    }
}
}
}

function doAuth(argCCAuth) {
    var authorizeNetCCAuthRequest = require('~cartridge/scripts/pipelets/AuthorizenetCCAuthRequest'),
    authResponse = authorizeNetCCAuthRequest.execute(argCCAuth);
    return authResponse;
}

    var authorizeNetVoidRequest = require('~cartridge/scripts/pipelets/AuthorizenetVoidRequest'),
    voidResponse = authorizeNetVoidRequest.execute(argVoid);
    return voidResponse;
}

```

## Sample Authorize.net checkout flow (SFRA based)

The code below is from the Authorize.net "AUTHORIZE\_NET-Authorize" controller which is triggered as part of authorization flow.

```
function Authorize(orderNumber, paymentInstrument, paymentProcessor) {
    var serverErrors = [],
        fieldErrors = {},
        error = false;

    try {
        Transaction.wrap(function () {
            paymentInstrument.paymentTransaction.setTransactionID(orderNumber);
            paymentInstrument.paymentTransaction.setPaymentProcessor(paymentProcessor);
        });

        var argCCAuth = {
            orderNumber : orderNumber,
            PaymentInstrument : paymentInstrument
        },
        authResponse = doAuth(argCCAuth);

        if (authResponse.result === false) {
            var argOrderValidate = {
                orderNumber : orderNumber,
                orderValidateAttemptInput : 1,
                request: request
            },
            forterCall = require('int_forter_sfira/cartridge/scripts/pipelets/forter/ForterValidate'),
            forterDecision = forterCall.validateOrder(argOrderValidate);

            // in case if no response from Forter, try to call one more time
            if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
                var argOrderValidate = {
                    orderNumber : orderNumber,
                    orderValidateAttemptInput : 2,
                    request: request
                },
                forterCall = require('int_forter_sfira/cartridge/scripts/pipelets/forter/ForterValidate'),
                forterDecision = forterCall.validateOrder(argOrderValidate);
            }

            error = true;
            serverErrors.push(
                Resource.msg('error.technical', 'checkout', null)
            );
        }

        if (authResponse.result === true) {
            var argOrderValidate = {
                orderNumber : orderNumber,
                orderValidateAttemptInput : 1,
                request: request
            },
            forterCall = require('int_forter_sfira/cartridge/scripts/pipelets/forter/ForterValidate'),
            forterDecision = forterCall.validateOrder(argOrderValidate);

            // in case if no response from Forter, try to call one more time
            if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
                var argOrderValidate = {

    return voidResponse;
}

```

## Sample Paypal Express Checkout Flow

When integrating with Paypal, we suggest you modify your Papal Cartridge settings (under Site Preferences -> Customer Site Preference Groups) so Forter will be able to receive relevant information and the Forter decision will control whether a transaction is captured or voided. Please note we do not handle Billing Agreement checkout flow in this example.

- a. The Express Checkout should include Authorization before Forter is called. This can be done by setting the Payment Action to "Authorization" or by setting Run Authorization in case of Order to Yes.

Merchant Tools / Site Preferences / Custom Site Preference Groups /

### Paypal ExpressCheckout/Credit/EasyPayments Configuration <sup>?</sup>

Instance Type: Sandbox

The diagrams below are from the PAYPAL\_EXPRESS-Authorize Pipeline.

After the "CommitTransaction" is called Forter requests additional information about the transaction from Paypal by triggering the Paypal-GetTransactionDetails API call. After the details are stored Forter API is called in order to provide a decision on the order.

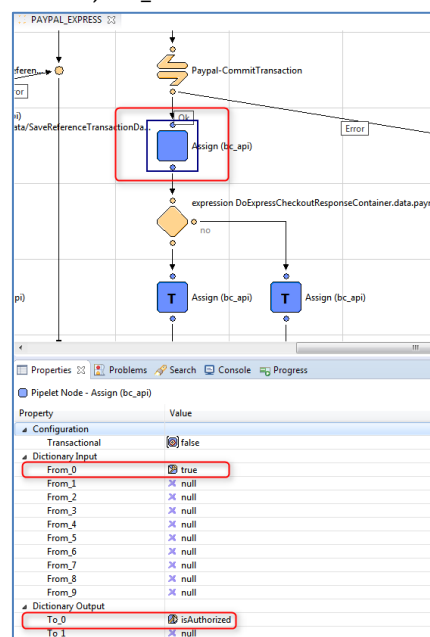

Based on the Forter Decision and the Forter Cartridge configuration, additional API calls are made to Paypal in order to capture or void the order as needed.

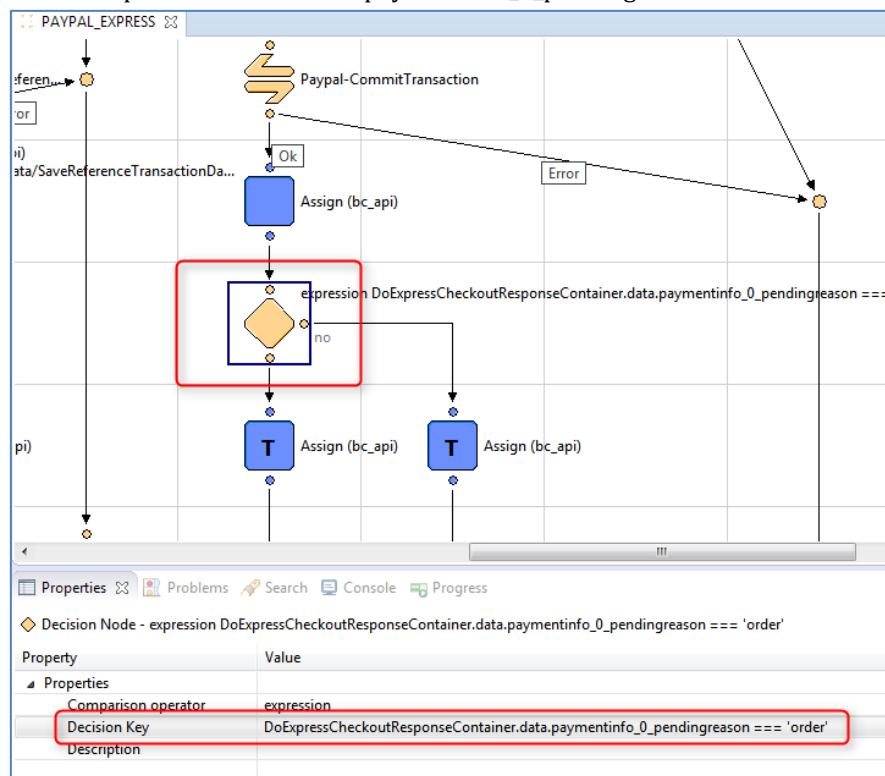

Below is detailed information about modifications from the previous images:

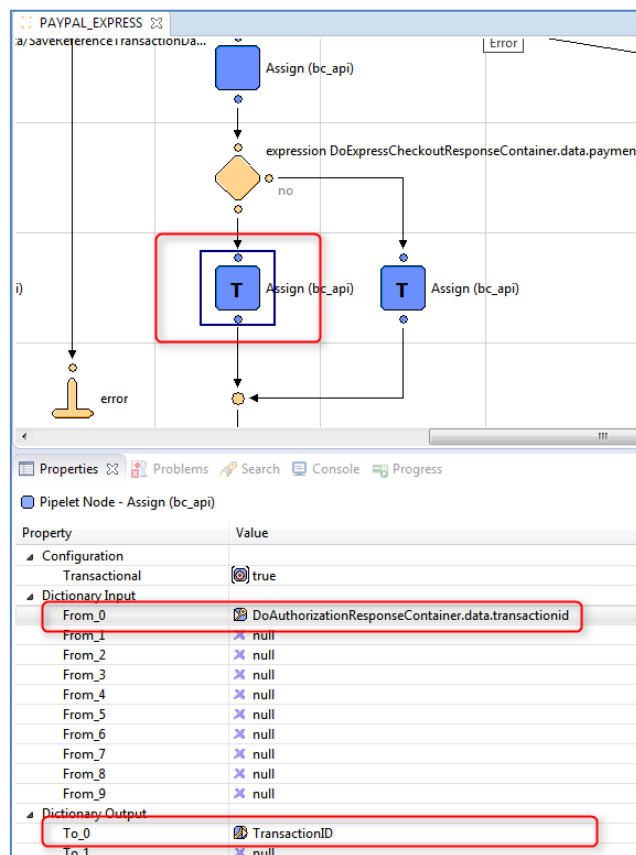

1. Add an Assign node. Set 'From\_0' to 'true'; 'To\_0' to 'isAuthorized'.

2. Add a Decision node. Set 'Decision Key' to 'DoExpressCheckoutResponseContainer.data.paymentinfo\_0\_pendingreason == 'order''.

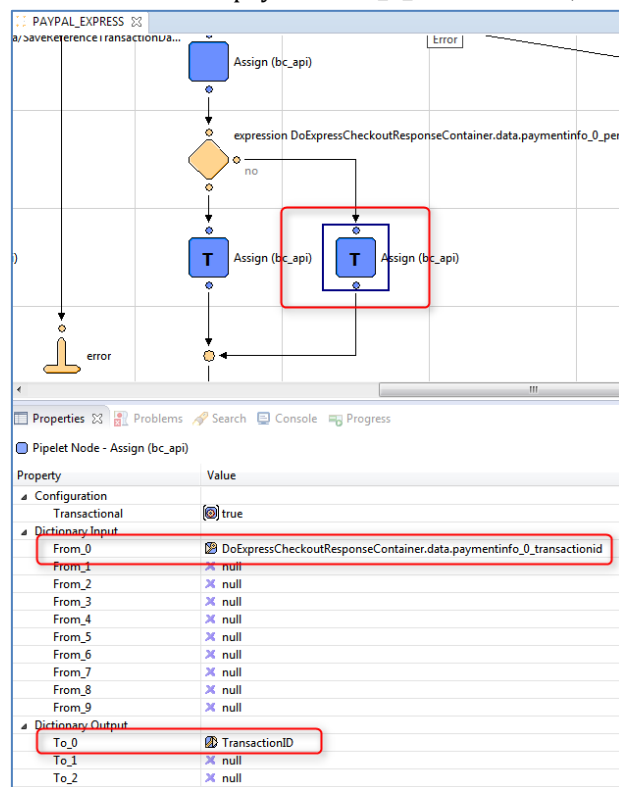

3. Add an Assign node. Set 'From\_0' to 'DoAuthorizationResponseContainer.data.transactionid'; 'To\_0' to 'TransactionID'.

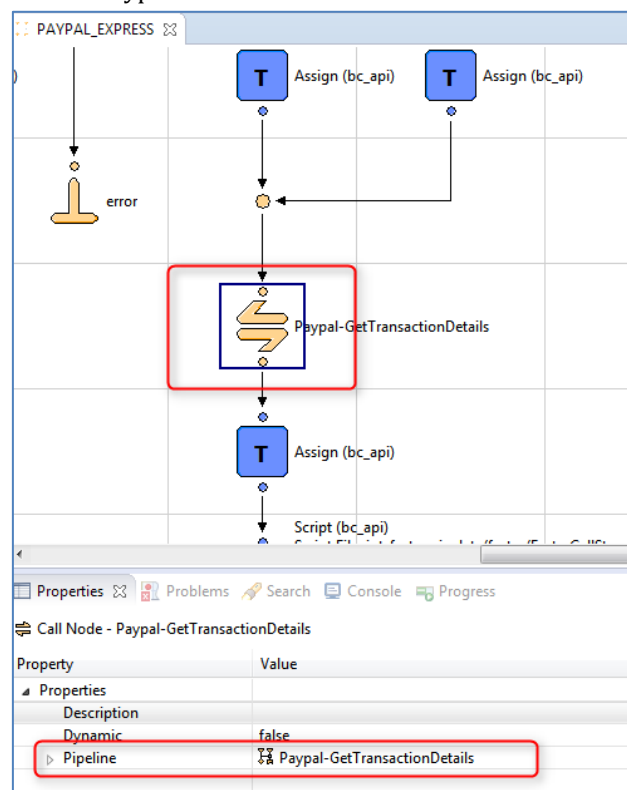

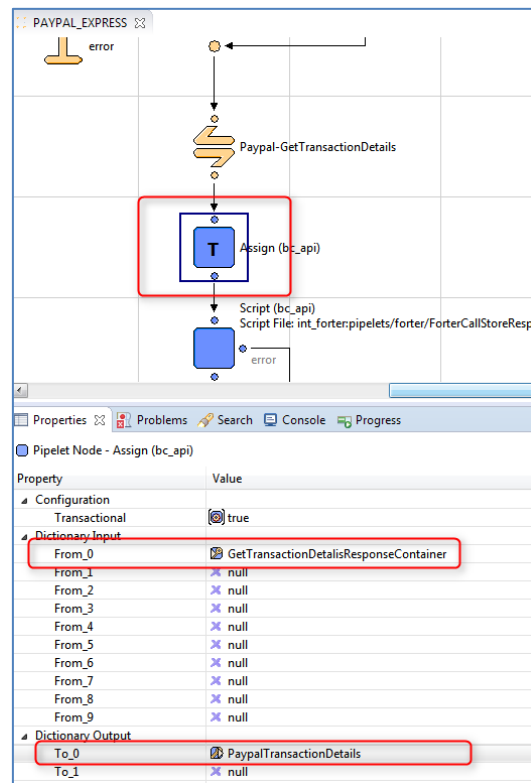

4. Add an Assign node. Set 'From\_0' to 'DoExpressCheckoutResponseContainer.data.paymentinfo\_0\_transactionid'; 'To\_0' to 'TransactionID'.

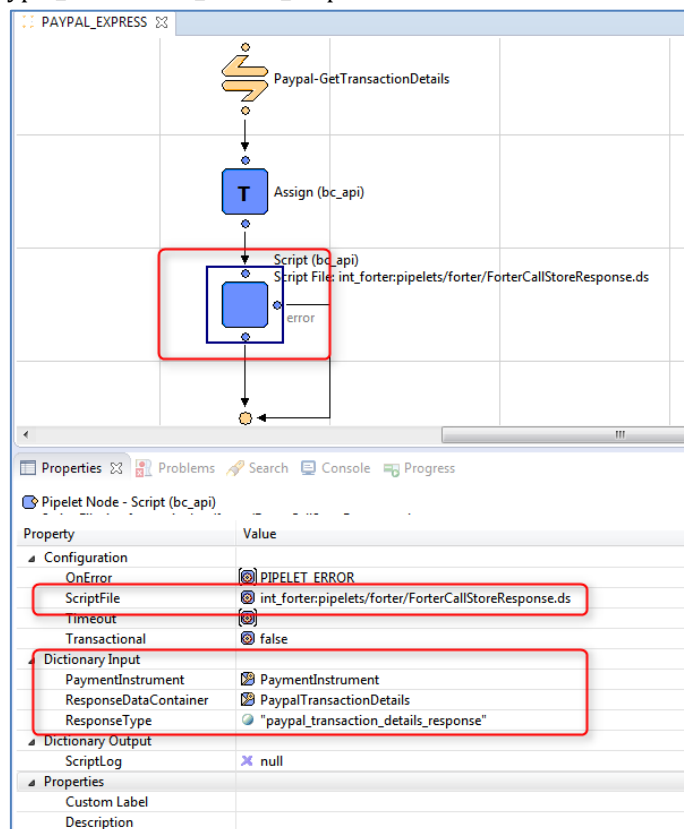

5. Add a Call node. Set 'Pipeline' to 'Paypal-GetTransactionDetails'.

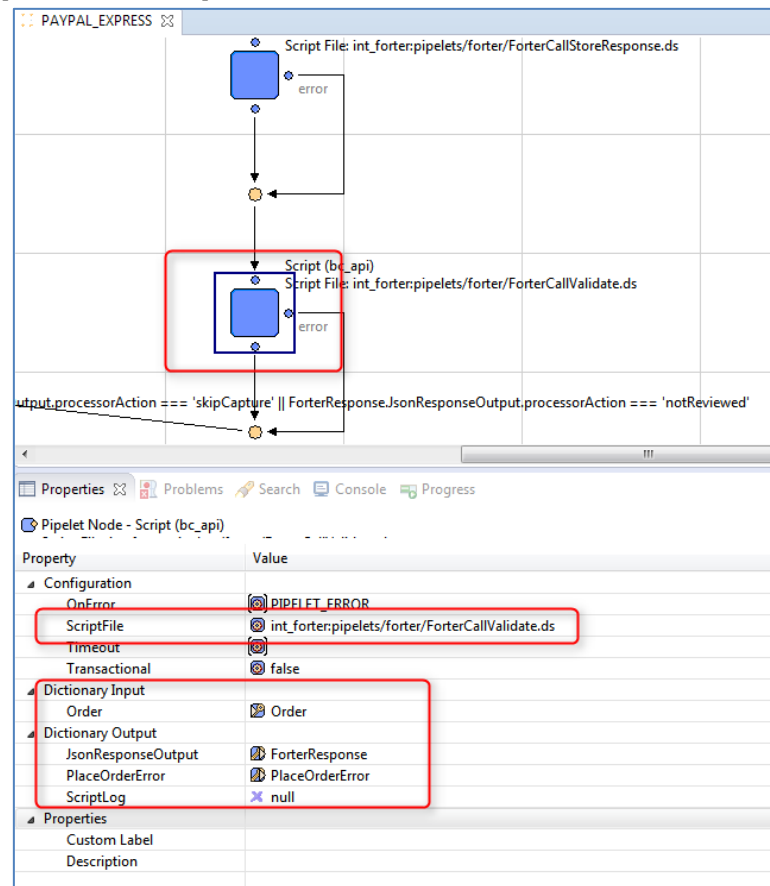

6. Add an Assign node. Set 'From\_0' to 'GetTransactionDetailsResponseContainer'; 'To\_0' to 'PaypalTransactionDetails'.

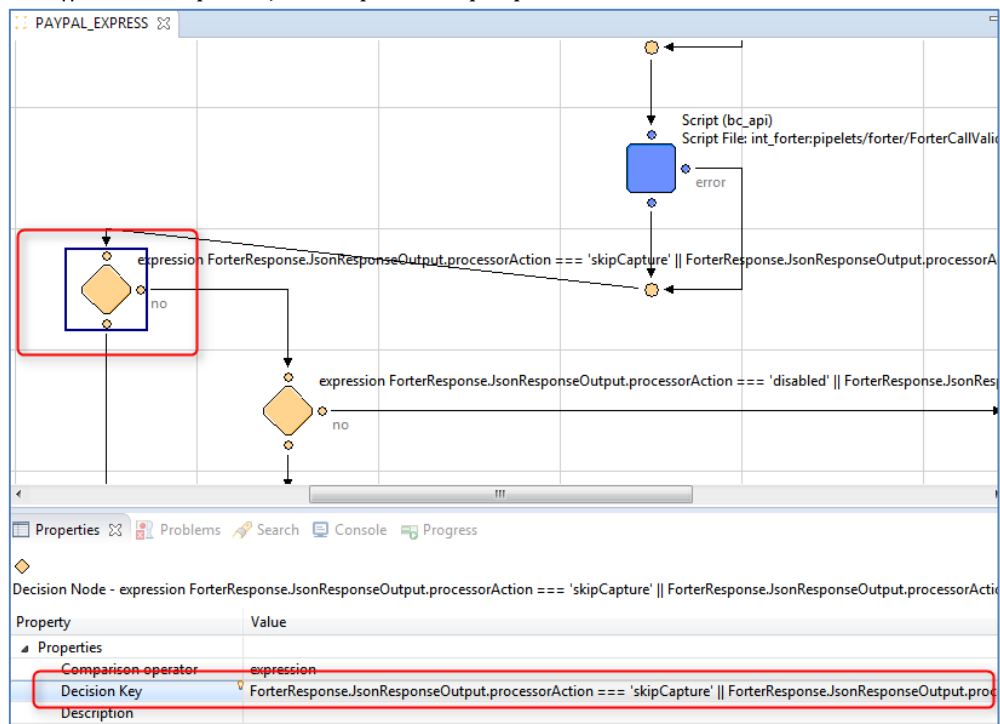

7. Add a Script node. Set 'ScriptFile' to 'int\_forter:pipelets/forter/ForterCallStoreResponse.ds'; 'PaymentInstrument' to 'PaymentInstrument'; 'ResponseDataContainer' to 'PaypalTransactionDetails'; 'ResponseType' to '"paypal\_transaction\_details\_response"'.

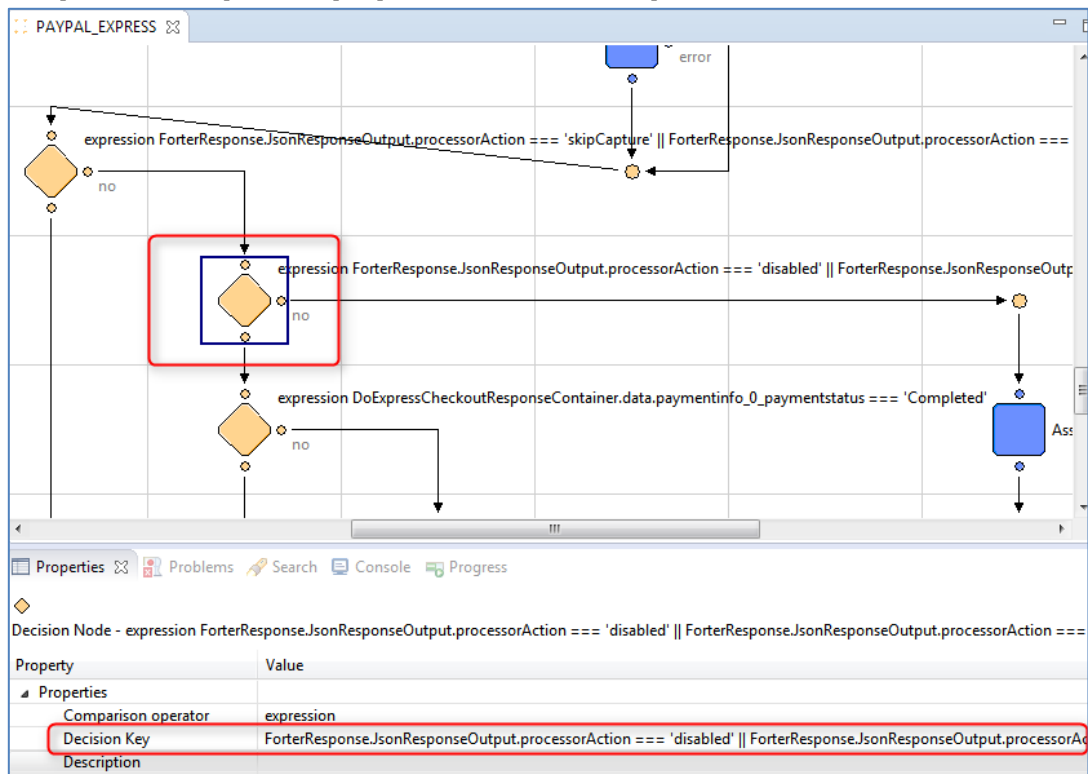

8. Add a Script node. Set 'ScriptFile' to 'int\_forter:pipelets/forter/ForterCallValidate.ds'; 'Order' to 'Order'; 'JsonResponseOutput' to 'ForterResponse'; 'PlaceOrderError' to 'PlaceOrderError'.

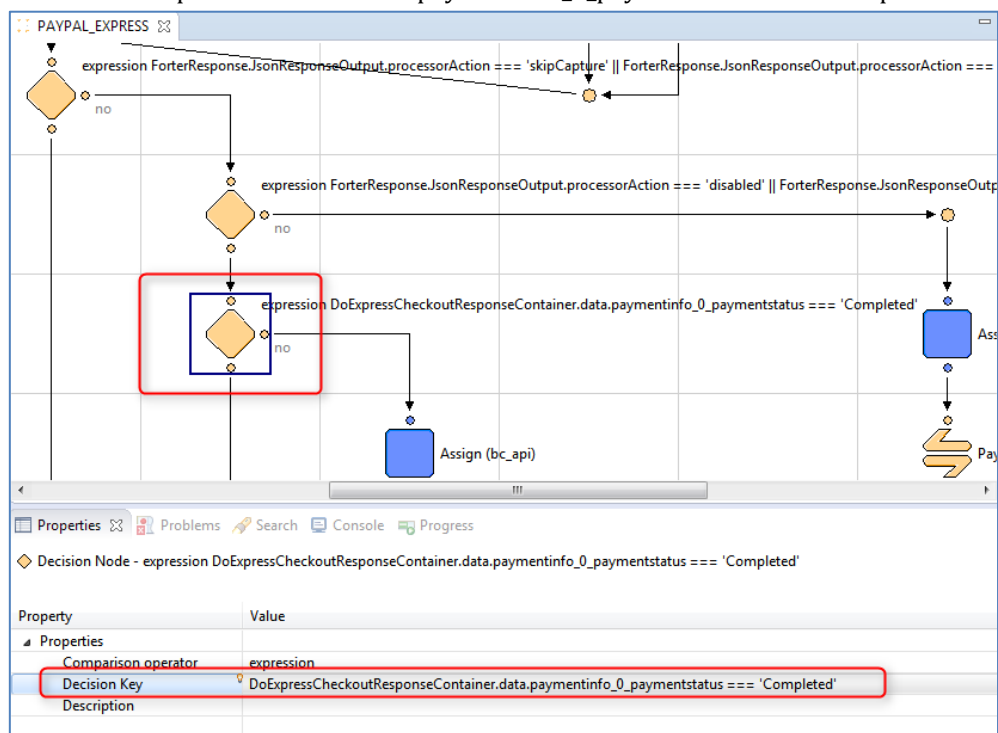

9. Add a Decision node. Set 'Decision Key' to 'ForterResponse.JsonResponseOutput.processorAction === 'skipCapture' || ForterResponse.JsonResponseOutput.processorAction === 'notReviewed'.

10. Add a Decision node. Set 'Decision Key' to 'ForterResponse.JsonResponseOutput.processorAction === 'disabled' || ForterResponse.JsonResponseOutput.processorAction === 'internalError' || ForterResponse.JsonResponseOutput.processorAction === 'capture'.

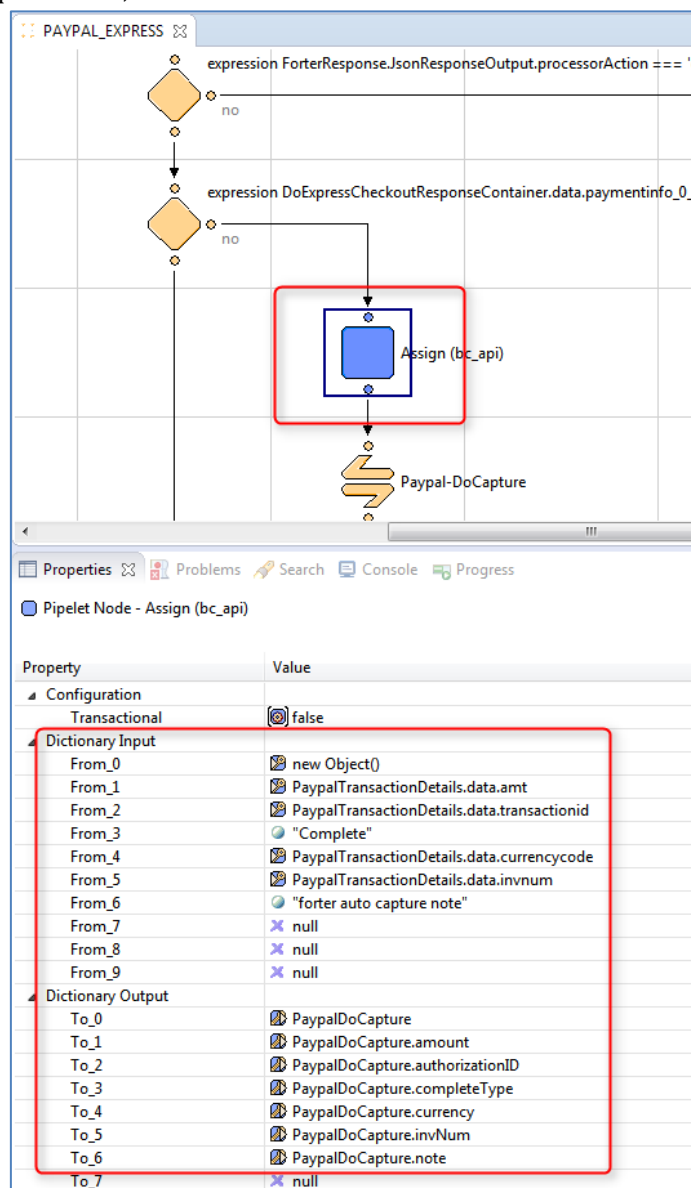

11. Add a Decision node. Set 'Decision Key' to 'DoExpressCheckoutResponseContainer.data.paymentinfo\_0\_paymentstatus === 'Completed'.

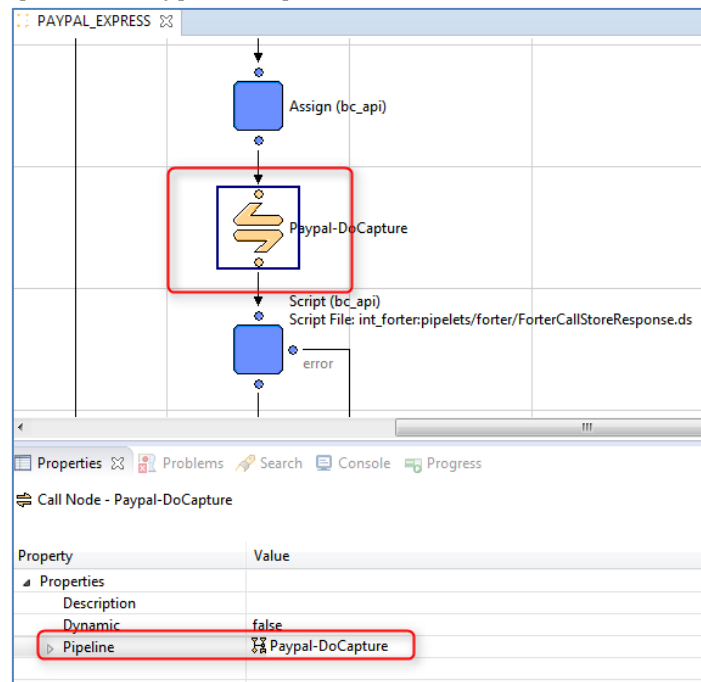

12. Add an Assign node. Set

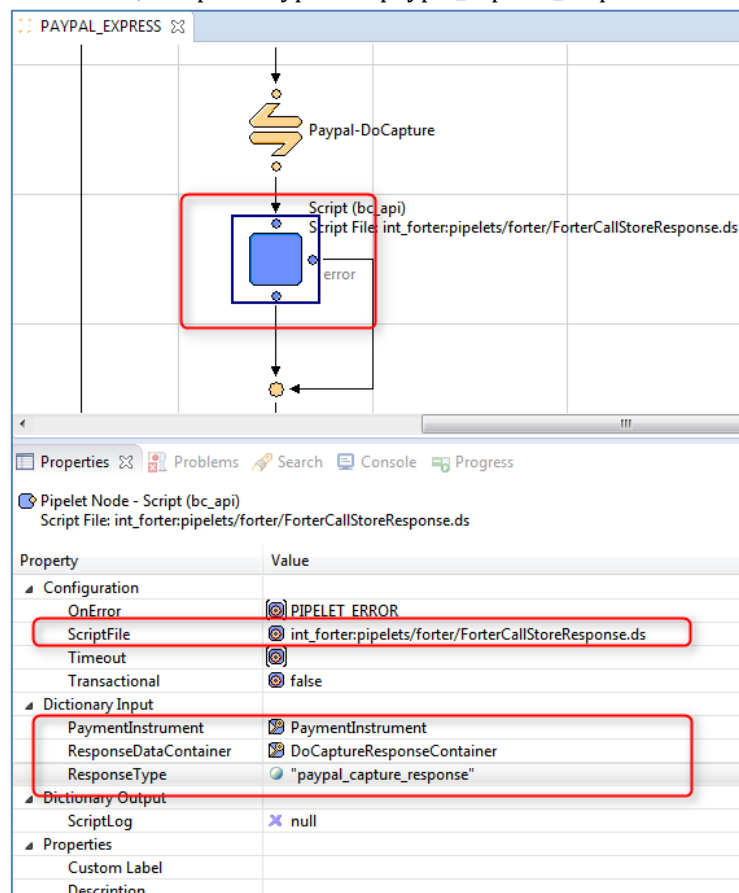

'From\_0' to 'new Object()';  
 'From\_1' to 'PaypalTransactionDetails.data.amt';  
 'From\_2' to 'PaypalTransactionDetails.data.transactionid';  
 'From\_3' to '"Complete"';  
 'From\_4' to 'PaypalTransactionDetails.data.currencycode';  
 'From\_5' to 'PaypalTransactionDetails.data.invnum';  
 'From\_6' to '"forter auto capture note"';  
 'To\_0' to 'PaypalDoCapture';  
 'To\_1' to 'PaypalDoCapture.amount';  
 'To\_2' to 'PaypalDoCapture.authorizationID';  
 'To\_3' to 'PaypalDoCapture.completeType';  
 'To\_4' to 'PaypalDoCapture.currency';  
 'To\_5' to 'PaypalDoCapture.invNum';  
 'To\_6' to 'PaypalDoCapture.note';

13. Add a Call node. Set 'Pipeline' to 'Paypal-DoCapture'.

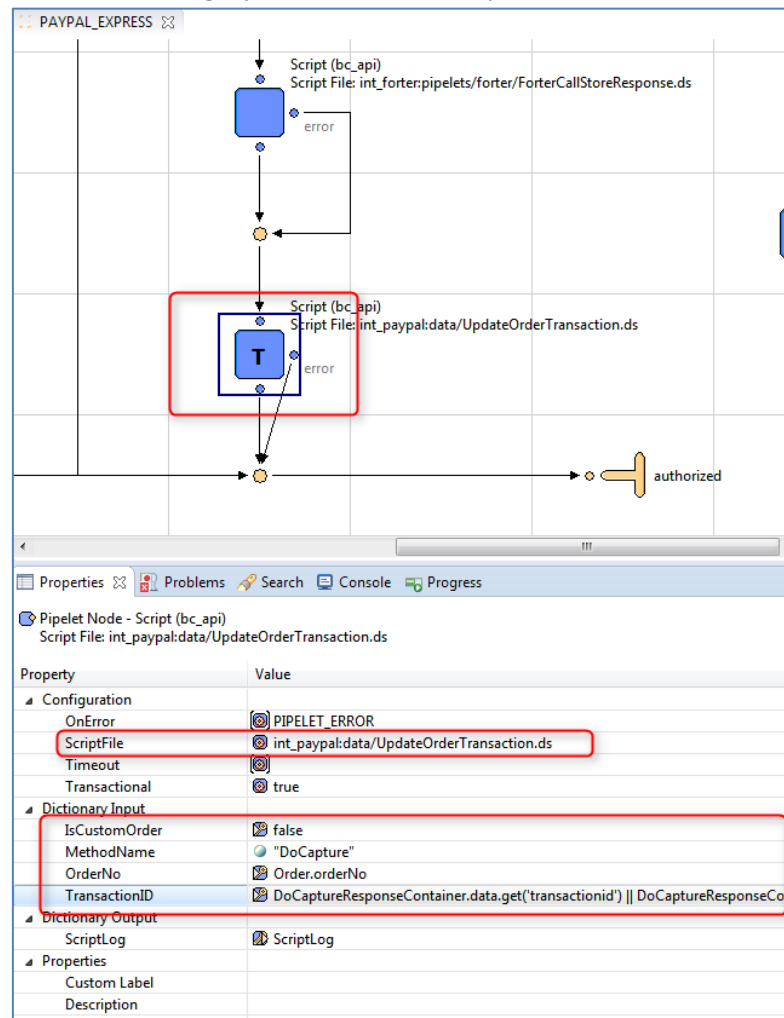

14. Add a Script node. Set 'ScriptFile' to 'int\_forter:pipelets/forter/ForterCallStoreResponse.ds'; 'PaymentInstrument' to 'PaymentInstrument'; 'ResponseDataContainer' to 'DoCaptureResponseContainer'; 'ResponseType' to '"paypal\_capture\_response"'.

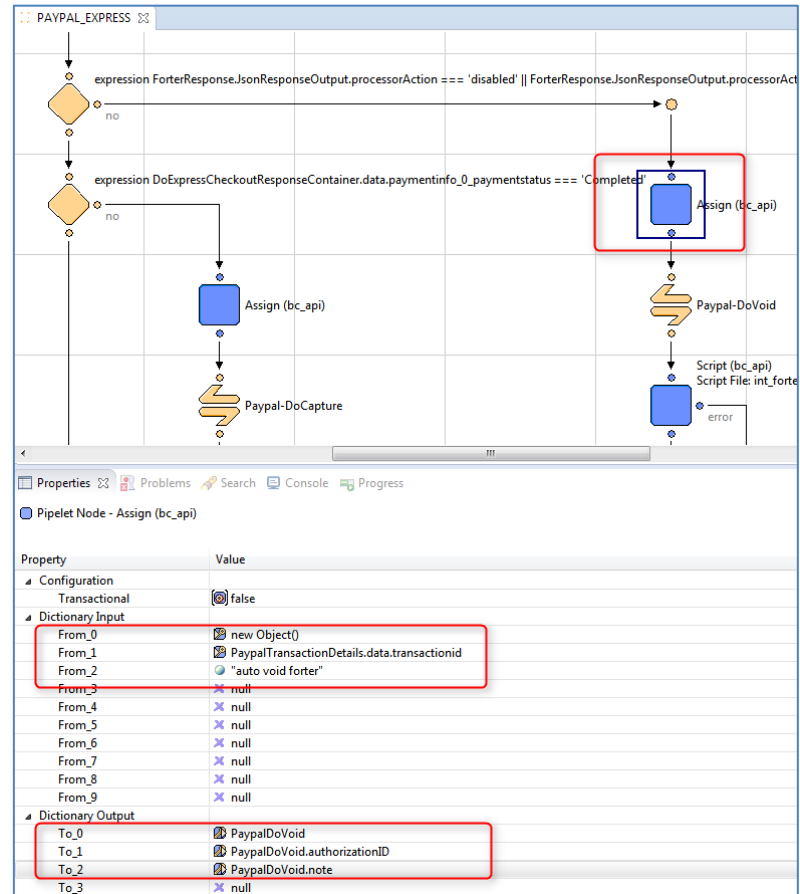

15. Add a Script node. Set

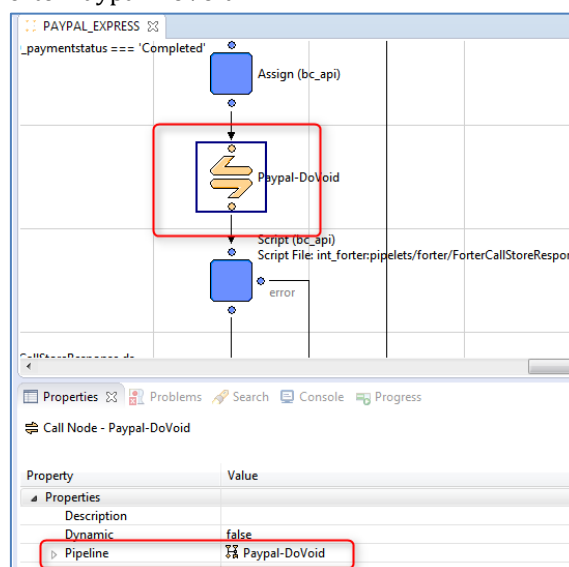

'ScriptFile' to 'int\_paypal:data/UpdateOrderTransaction.ds';  
'IsCustomOrder' to 'false';  
'MethodName' to '"DoCapture"';  
'OrderNo' to 'Order.orderNo';  
'TransactionID' to 'DoCaptureResponseContainer.data.get('transactionid') ||  
DoCaptureResponseContainer.data.get('authorizationid') ||  
DoCaptureResponseContainer.data.get('refundtransactionid')'.

16. Add an Assign node. Set
  - 'From\_0' to 'new Object()';
  - 'From\_1' to 'PaypalTransactionDetails.data.transactionid';
  - 'From\_2' to '"auto void forter"';
  - 'To\_0' to 'PaypalDoVoid';
  - 'To\_1' to 'PaypalDoVoid.authorizationID';
  - 'To\_2' to 'PaypalDoVoid.note';

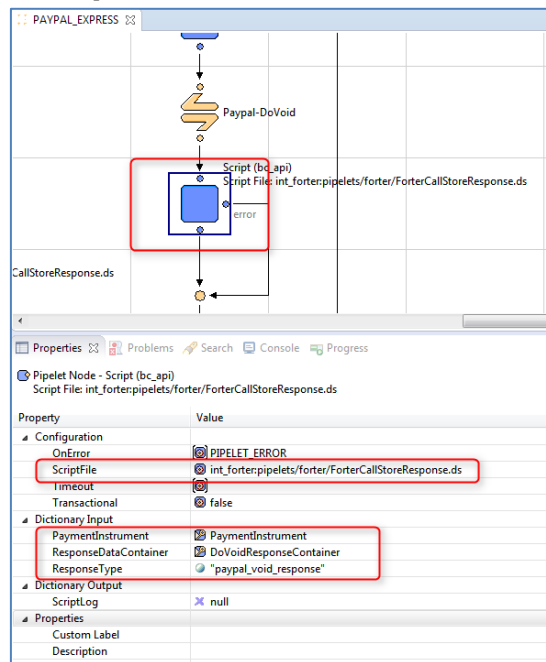

17. Add a Call node. Set 'Pipeline' to 'Paypal-DoVoid'.

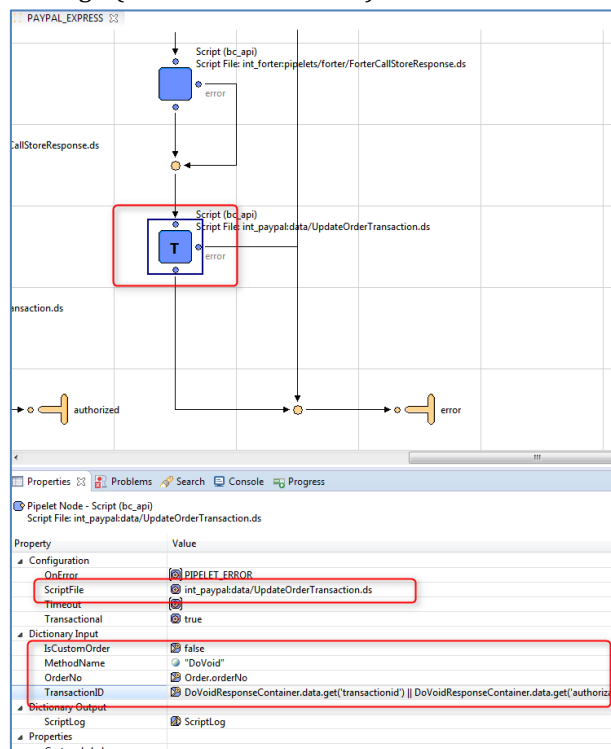

18. Add a Script node. Set 'ScriptFile' to 'int\_forter:pipelets/forter/ForterCallStoreResponse.ds';  
 'PaymentInstrument' to 'PaymentInstrument'; 'ResponseDataContainer' to 'DoVoidResponseContainer';  
 'ResponseType' to "paypal\_void\_response".

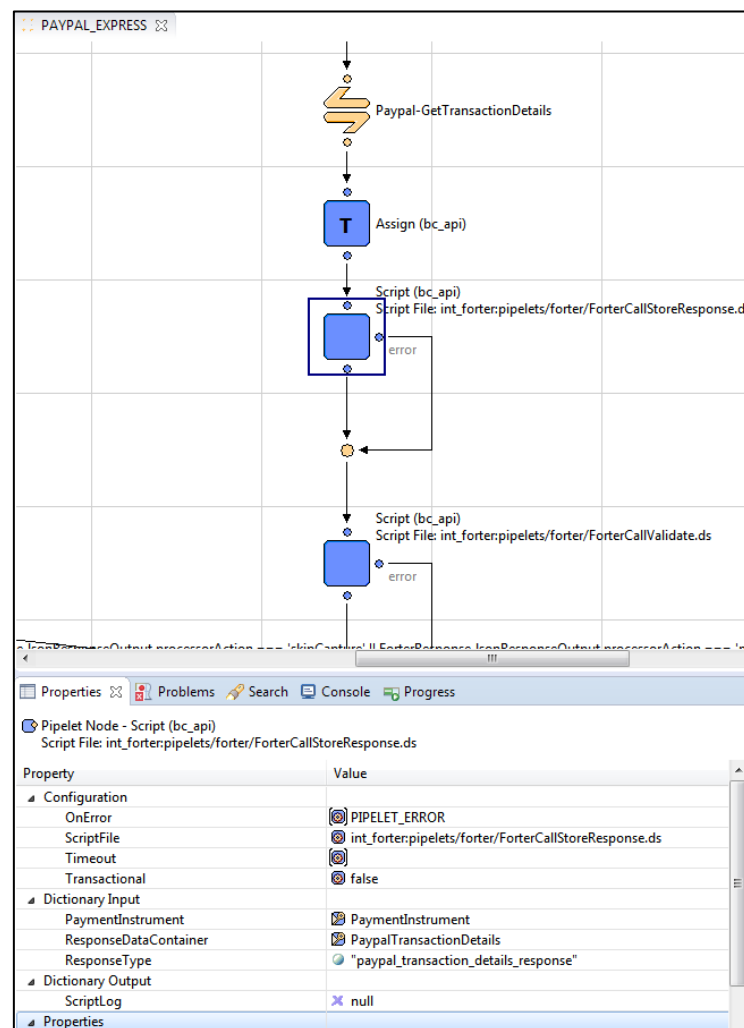

19. Add a Script node. Set  
 'ScriptFile' to 'int\_paypal:data/UpdateOrderTransaction.ds';  
 'IsCustomOrder' to 'false';  
 'MethodName' to "DoVoid";  
 'OrderNo' to 'Order.orderNo';  
 'TransactionID' to 'DoVoidResponseContainer.data.get('transactionid') ||  
 DoVoidResponseContainer.data.get('authorizationid') ||  
 DoVoidResponseContainer.data.get('refundtransactionid')'.

The Forter cartridge has built-in functionality for saving the PayPal API responses – the transaction details, capture, void, authorization and expresscheckout responses. The data is stored as a JSON string in the custom attribute of the Order Payment Instrument object. Each response is saved to its dedicated custom attribute. The recommended type for these custom attributes is Text since in some cases the response is over 4K characters. In order to save the PayPal response a script node must be added in the place where the required data exists.

For example PayPal transaction details may be saved right after a call to PaypPal-GetTransacriionDetails and passed into the int\_forter:pipelets/forter/ForterCallStoreResponse.ds script.

In the script Dictionary Input the “paypal\_transaction\_details\_response” is actually the type of the response custom attribute, “PaypalTransactionDetails” is an object which contains information about current transaction and “PaymentInstrument” is current payment instrument.

In order to handle the customized error message configured in Forter business manager extension, for case if PayPal payment processor called via hooks (if the main site built on controllers), the `int_paypal/cartridge/scripts/payment/processor/PAYPAL_EXPRESS.js` must check if any error exists in `pdict`, for example via the if statement `if(!empty(pdict.ForterResponse.PlaceOrderError)){}`:

```

1  'use strict';
2
3  /* API Includes */
4  var Pipeline = require('dw/system/Pipeline');
5  var OrderMgr = require('dw/order/OrderMgr');
6  var URLUtils = require('dw/web/URLUtils');
7
8  function Handle(args) {
9      var pdict = Pipeline.execute('PAYPAL_EXPRESS-Handle', {
10         Basket: args.Basket,
11         ContinueURL: URLUtils.https('Paypal-ContinueExpressCheckout')
12     });
13     if(pdict.isSuccess) {
14         return {success: true};
15     } else {
16         return {error: true};
17     }
18 }
19
20 function Authorize(args) {
21     var pdict = Pipeline.execute('PAYPAL_EXPRESS-Authorize', {
22         Order: OrderMgr.getOrder(args.OrderNo),
23         PaymentInstrument: args.PaymentInstrument
24     });
25     if(pdict.isAuthorized) {
26         if (!empty(pdict.ForterResponse.PlaceOrderError)) {
27             return {error: true, forterErrorCode : pdict.ForterResponse.PlaceOrderError};
28         } else if (
29             (!empty(pdict.ForterResponse.JsonResponseOutput.actionEnum) && pdict.ForterResponse.JsonResponseOutput.actionEnum == 'DECLINED')
30             &&
31             (!empty(pdict.ForterResponse.JsonResponseOutput.processorAction) && pdict.ForterResponse.JsonResponseOutput.processorAction != 'skipCapture')
32         ) {
33             return {error: true};
34         } else {
35             return {authorized: true};
36         }
37     } else {
38         return {error: true};
39     }
40 }
41
42 /* Module exports
43 */
44 /*
45 * Local methods
46 */
47 exports.Handle = Handle;
48 exports.Authorize = Authorize;
49

```

In order to handle the customized error message configured in Forter business manager extension the COPlaceOrder.js must be adjusted to check if any error exists in the authorizationResult:

- inside the handlePayments(order) function
 

```

      if (authorizationResult.not_supported || authorizationResult.error) {
        if (!empty(authorizationResult.forterErrorCode)) {
          return {
            error          : true,
            forterErrorCode : authorizationResult.forterErrorCode
          };
        } else {
          return {error : true};
        }
      }
    
```

```

59     if (PaymentMgr.getPaymentMethod(paymentInstrument.getPaymentMethod()).getPaymentProcessor() === null) {
60
61         Transaction.wrap(handlePaymentTransaction);
62
63     } else {
64
65         var authorizationResult = PaymentProcessor.authorize(order, paymentInstrument);
66
67         if (authorizationResult.not_supported || authorizationResult.error) {
68             if (!empty(authorizationResult.forterErrorCode)) {
69                 return {
70                     error          : true,
71                     forterErrorCode : authorizationResult.forterErrorCode
72                 };
73             } else {
74                 return {error : true};
75             }
76         }
77     }
78 }
79
80
81 return {};
82 }
83
  
```

- inside the start() function
 

```

      return {
        error: true,
        PlaceOrderError: new Status(Status.ERROR, handlePaymentsResult.forterErrorCode
        ? handlePaymentsResult.forterErrorCode.code : 'confirm.error.technical')
      };
    
```

```

152     if (!order) {
153         // TODO - need to pass BasketStatus to Cart-Show ?
154         app.getController('Cart').Show();
155     }
156     return {};
157 }
158 var handlePaymentsResult = handlePayments(order);
159
160 if (handlePaymentsResult.error) {
161     return Transaction.wrap(function () {
162         OrderMgr.failOrder(order);
163         return {
164             error: true,
165             PlaceOrderError: new Status(Status.ERROR, handlePaymentsResult.forterErrorCode ? handlePaymentsResult.forterErrorCode.code : 'confirm.error.technical')
166         };
167     });
168 }
169 } else if (handlePaymentsResult.missingPaymentInfo) {
170     return Transaction.wrap(function () {
  
```

## Adjusting the Forter Cartridge to include your processor response

The ForterOrder.ds file must be edited to use the response from your payment processor. This script is used to generate the request object for Forter validation. In the example below, we store the response from authorize.net on the payment instrument itself in a custom attribute to be used in this script. If your implementation does not store the response on the payment instrument, you can pass the response object from your payment processor to the validateOrder function (ForterValidate.js controller) as input, which will be sent as a parameter to the ForterOrder.ds file to generate the request object. The script has commented code as an example to see which values need to be sent (optional/required).

```
2
3 /**
4  * ForterOrder class is the DTO object for request.
5  *
6  * To include this script use:
7  * var ForterOrder = require("int_forter/cartridge/scripts/lib/forter/dto/ForterOrder.ds");
8  */
9 function ForterOrder(args) {
10     var order      = args.Order,
11         isRetryJob  = args.IsRetryJob,
12         site        = dw.system.Site.getCurrent(),
13         paymentInstruments = order.getPaymentInstruments(),
14         payment     = null,
15         authResponse = null,
16         shipment    = null;
17
18
19     for each (var paymentInstrument in paymentInstruments) {
20         if (paymentInstrument.paymentMethod == 'CREDIT_CARD') {
21             payment = paymentInstrument;
22             authResponse = new XML(paymentInstrument.custom.authorize_net_authorization);
23         } else if (paymentInstrument.paymentMethod == 'PayPal' || paymentInstrument.paymentMethod == 'BML') {
24             payment = paymentInstrument;
25             authResponse = paymentInstrument.custom.paypal_transaction_details_response;
26         }
27     }
28 }
```

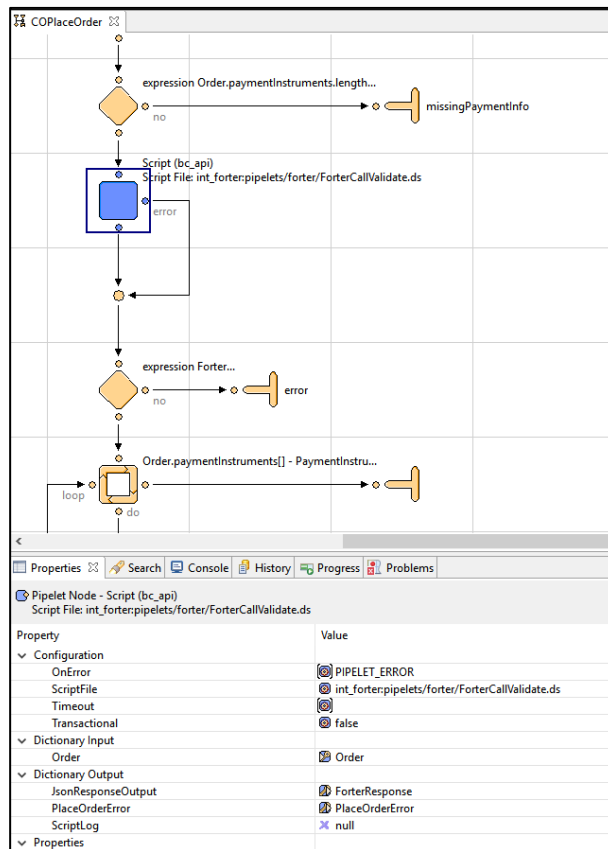

*The verificationResults and paymentGatewayData object in the ForterCreditCard function must be adjusted according to the payment gateway used*

### Pre-Authorization Flow

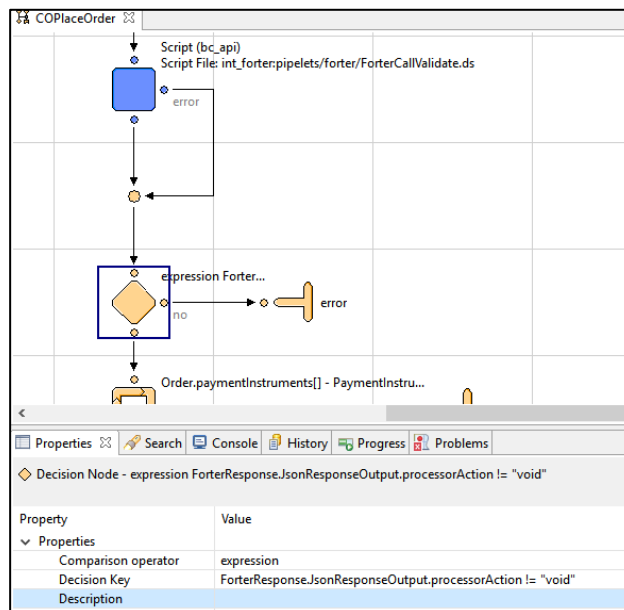

This is not part of the default integration with Forter. This section should be implemented only on specific use cases. Please consult your account manager/integration engineer in Forter before implementing.

For Pipeline-based websites update pipeline:

1. COPlaceOrder-HandlePayments. Add script int\_forter:pipelets/forter/ForterCallValidate.ds with parameters shown below. Input: Order, Output: ForterResponse and PlaceOrderError.

2. Add a Decision node with expression: `ForterResponse.JsonResponseOutput.processorAction != "void"`

For Controllers-based websites update controller:

1. COPlaceOrder.js (in the handlepayments (order) function):

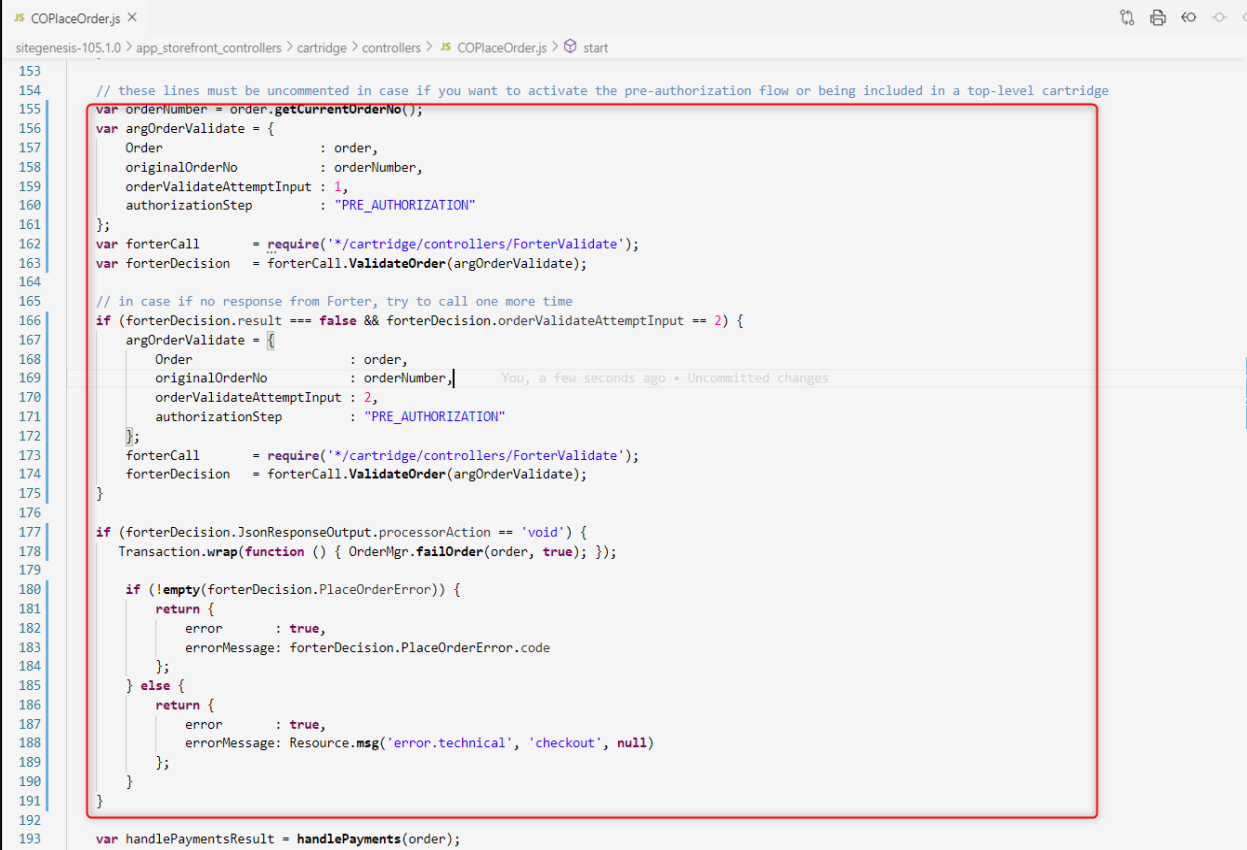

```
var argOrderValidate = {
  Order: order,
  orderValidateAttemptInput: 1,
  authorizationStep: "PRE_AUTHORIZATION"
},
forterController = require('int_forter/cartridge/controllers/ForterValidate'),
```

```

    forterDecision = forterController.ValidateOrder(argOrderValidate);
    // in case if no response from Forter, try to call one more time
    if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
        var argOrderValidate = {
            Order: order,
            orderValidateAttemptInput: 2,
            authorizationStep: "PRE_AUTHORIZATION"
        },
        forterController = require('int_forter/cartridge/controllers/ForterValidate'),
        forterDecision = forterController.ValidateOrder(argOrderValidate);
    }

    if (forterDecision.JsonResponseOutput.processorAction == 'void') {
        if (!empty(forterDecision.PlaceOrderError)) {
            return {error: true, forterErrorCode: forterDecision.PlaceOrderError.code};
        } else {
            return {error: true};
        }
    }
}

```

```

153
154 // these lines must be uncommented in case if you want to activate the pre-authorization flow or being included in a top-level cartridge
155 var orderNumber = order.getCurrentOrderNo();
156 var argOrderValidate = {
157     Order: order,
158     originalOrderNo: orderNumber,
159     orderValidateAttemptInput: 1,
160     authorizationStep: "PRE_AUTHORIZATION"
161 };
162 var forterCall = require('*/cartridge/controllers/ForterValidate');
163 var forterDecision = forterCall.ValidateOrder(argOrderValidate);
164
165 // in case if no response from Forter, try to call one more time
166 if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {

191 }
192
193 var handlePaymentsResult = handlePayments(order);

```

## 2. COPlaceOrder.js (in the start() function):

```

if (!empty(handlePaymentsResult.forterErrorCode)) {
    return {
        error: true,
        PlaceOrderError: new Status(Status.ERROR, handlePaymentsResult.forterErrorCode)
    };
} else {
    return {

```

```

    error: true,
    PlaceOrderError: new Status(Status.ERROR, 'confirm.error.technical')
  };
}

```

```

COPlaceOrder.js
175
176     app.getController('Cart').Show();
177
178     return {};
179   }
180   var handlePaymentsResult = handlePayments(order);
181
182   if (handlePaymentsResult.error) {
183     return Transaction.wrap(function () {
184       OrderMgr.failOrder(order);
185
186       if (!empty(handlePaymentsResult.forterErrorCode)) {
187         return {
188           error: true,
189           PlaceOrderError: new Status(Status.ERROR, handlePaymentsResult.forterErrorCode)
190         };
191       } else {
192         return {
193           error: true,
194           PlaceOrderError: new Status(Status.ERROR, 'confirm.error.technical')
195         };
196       }
197     });
198
199   } else if (handlePaymentsResult.missingPaymentInfo) {
200     return Transaction.wrap(function () {
201       OrderMgr.failOrder(order);
202       return {
203         error: true,
204         PlaceOrderError: new Status(Status.ERROR, 'confirm.error.technical')
205       };
206     });
207   }
208
209   var orderPlacementStatus = Order.submit(order);
210   if (!orderPlacementStatus.error) {
211     clearForms();
212   }
213   return orderPlacementStatus;
214

```

For SFRA-based websites, the CheckoutServices.js has been updated. Please note that the Forter cartridge replaces the 'PlaceOrder' endpoint, so these lines must be uncommented in case if you want to activate the pre-authorization flow or being included in a top-level cartridge:

1. CheckoutServices.js (replaces the 'PlaceOrder' with next code includes) in order send order information to the Forter endpoint before authorization call and after to handle the customized error message configured in Forter business manager extension:

```

var orderNumber = order.getCurrentOrderNo();
var argOrderValidate = {
  orderNumber      : orderNumber,
  orderValidateAttemptInput : 1,
  authorizationStep: "PRE_AUTHORIZATION"
},
forterCall  = require("*/cartridge/scripts/pipelets/forter/forterValidate"),
forterDecision = forterCall.validateOrder(argOrderValidate);

// in case if no response from Forter, try to call one more time
if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
  var argOrderValidate = {
    orderNumber      : orderNumber,
    orderValidateAttemptInput : 2,

```

```

        authorizationStep: "PRE_AUTHORIZATION"
    },
    forterCall    = require('*/cartridge/scripts/pipelets/forter/forterValidate'),
    forterDecision = forterCall.validateOrder(argOrderValidate);
}
if (forterDecision.JsonResponseOutput.processorAction == 'void') {
    Transaction.wrap(function () { OrderMgr.failOrder(order, true); });
    if (!empty(forterDecision.PlaceOrderError)) {
        res.json({
            error : true,
            errorMessage : forterDecision.PlaceOrderError.code
        });
    } else {
        res.json({
            error : true,
            errorMessage : Resource.msg('error.technical', 'checkout', null)
        });
    }
}
this.emit('route:Complete', req, res);
return;
}

```

```

131 // these lines must be uncommented in case if you want to activate the pre-authorization flow or being included in a top-level cartridge
132 var orderNumber = order.getCurrentOrderNo();
133 var argOrderValidate = {
134     orderNumber      : orderNumber,
135     orderValidateAttemptInput : 1,
136     authorizationStep  : "PRE_AUTHORIZATION"
137 };
138 var forterCall    = require('*/cartridge/scripts/pipelets/forter/forterValidate');
139 var forterDecision = forterCall.validateOrder(argOrderValidate);
140
141 // in case if no response from Forter, try to call one more time
142 if (forterDecision.result === false && forterDecision.orderValidateAttemptInput == 2) {
143     argOrderValidate = {
144         orderNumber      : orderNumber,
145         orderValidateAttemptInput : 2,
146         authorizationStep  : "PRE_AUTHORIZATION"
147     };
148     forterCall    = require('*/cartridge/scripts/pipelets/forter/forterValidate');
149     forterDecision = forterCall.validateOrder(argOrderValidate);
150 }
151
152 if (forterDecision.JsonResponseOutput.processorAction == 'void') {
153     Transaction.wrap(function () { OrderMgr.failOrder(order, true); });
154     if (!empty(forterDecision.PlaceOrderError)) {
155         res.json({
156             error : true,
157             errorMessage : forterDecision.PlaceOrderError.code
158         });
159     } else {
160         res.json({
161             error : true,
162             errorMessage : Resource.msg('error.technical', 'checkout', null)
163         });
164     }
165 }
166
167 this.emit('route:Complete', req, res);
168 return;
169 }

```

You can use the code below to update the order pre-authorized with a new status, generally, this will be placed on the script responsible to handle the credit card process, you can find this code in the AUTHORIZE\_NET script as an example of implementation.

The code applies for all implementation, SFRA and SG.

```

var argOrderUpdate = {

    orderNumber: orderNumber,

```

```

    updateAttempt: 1
  },
  forterCall = require('*/cartridge/scripts/pipelets/forter/forterValidate'),
  forterDecision = forterCall.postAuthOrderStatusUpdate(argOrderUpdate, "PROCESSING");

  if (forterDecision.result === false && forterDecision.updateAttempt == 2) {
    forterDecision.updateAttempt = 2;
    forterCall.postAuthOrderStatusUpdate(argOrderUpdate, "PROCESSING");
  }
}

```

By default the status is CANCELED\_BY\_MERCHANT or PROCESSING.

```

// these lines must be uncommented in case if you want to activate the pre-authorization flow + post-auth order status update - uncomment this and
var argOrderUpdate = {
  orderNumber: orderNumber,
  updateAttempt: 1
},
forterCall = require('*/cartridge/scripts/pipelets/forter/forterValidate'),
forterDecision = forterCall.postAuthOrderStatusUpdate(argOrderUpdate, "PROCESSING");

if (forterDecision.result === false && forterDecision.updateAttempt == 2) {
  forterDecision.updateAttempt = 2;
  forterCall.postAuthOrderStatusUpdate(argOrderUpdate, "PROCESSING");
}

```

### 3.3.5 Footer

Please note that Forter's custom JavaScript snippet, which captures vital behavioral data, has been added to the SiteGenesis footer. SiteGenesis footer.isml has been modified in order to add the mentioned functionality.

```
<!-- ===== -->
<!-- == -->
<!-- == FORTER INTEGRATION == -->
<!-- == -->
<!-- ===== -->
<!--
  Renders the Forter js snippet
-->
<isinclude template="custom/fortersnippetjs"/>
```

## 3.4 Testing

In order to see if the cartridge is installed and configured correctly, you need to go to the Storefront and place some test orders, both as a registered customer and as a guest customer. Then, go to check the order status in the Forter dedicated page Merchant Tools > Forter > Orders.

A registered customer will log in, add an item to the cart and proceed to checkout, while the guest customer may add the item in the cart and proceed directly to checkout page. After the shipping, billing and payment information has been provided the customer will be able to place the order. If the payment information is not valid, the payment gateway will fail the order and the Salesforce Commerce Cloud standard failed message is displayed. If the Forter configuration is to cancel the order immediately and show a decline page when Forter declines the order than a customized error message will be displayed.

The screenshot shows a checkout page with a red banner at the top stating "Your order has been declined". The page is divided into three main sections: a product list, an order summary, and a shipping address. The product list shows a "Drape Neck Blouse" with a quantity of 1 and a total of \$54.99. The order summary shows a subtotal of \$54.99, shipping ground of \$5.99, shipping discount of -\$3.00, sales tax of \$2.90, and an order total of \$60.88. The shipping address is listed as "lore dana Interpro Madison, AL 35758 United States" with a method of "Ground". A "PLACE ORDER" button is visible at the bottom right.

PRODUCT	QTY	TOTAL
 <b>Drape Neck Blouse</b> Item No: 701643469451 Color: White Size: M	1 In Stock	\$54.99

ORDER SUMMARY <a href="#">Edit</a>	
Subtotal	\$54.99
<a href="#">Edit</a> Shipping Ground	\$5.99
Shipping Discount	-\$3.00
Sales Tax	\$2.90
<b>Order Total:</b>	<b>\$60.88</b>

SHIPPING ADDRESS <a href="#">Edit</a>	
lore dana	
Interpro	
Madison, AL 35758	
United States	
Method: Ground	

[Edit Cart](#) [PLACE ORDER](#)

Otherwise the order will be successfully processed and the thank you page will be displayed. The merchant should also check the Forter decision and the order status in the site preferences section.

## 4. Operations, Maintenance

### 4.1 Data Storage

The cartridge stores response information from Forter in the Order system object definition via custom attributes in order to process the orders. It also stores the first 6 digits of the customer credit card number if there are errors in the request to Forter.

### 4.2 Availability

#### 4.2.1 Forter error / Failover

Every error that is related to Forter is reported to the Forter errors API endpoint. The request payload contains error description, order ID and stack trace payload in JSON format. In case of service unavailability second attempt is performed. In case of second attempt fail – an order will contain 'Error' in the Forter decision attribute.

The screenshot shows a web interface with tabs: General, Attributes (selected), Payment, Notes, and History. The title is 'Attributes for Order '00145401''. Below the title is a note: 'On this page you can edit the attributes of the order. Fields with a red asterisk (\*) are mandatory. Click Apply to save changes. Click Reset to revert your changes.' The main content area is titled 'Forter group' and contains several attributes, each with a small icon to its left:

- Forter decision: \* ERROR (Error)
- Forter Order Link: No data is available
- Forter Order Status: No data is available
- Mapping to Forter statuses according the order status: No data is available
- Forter User Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/80.0.3987.100 Safari/537.36
- Forter Token Cookie: f10dbe98ad9e4da7a9c44880be9b54db\_1581593197649\_\_UDF43\_9ok
- Retry number: 2

At the bottom right of the form are two buttons: 'Apply' and 'Reset'.

### 4.3 Support

Supporting documentation and data will be provided:

- **Archived cartridge**
- **Configuration / installation files**

Please contact your Forter sales representative at [info@forter.com](mailto:info@forter.com) for more details about the integration process.

## 5. User Guide

### 5.1 Roles, Responsibilities

Salesforce Commerce Cloud merchants who have purchased the cartridge and have access rights to the Salesforce Commerce Cloud Business Manager and to configure the cartridge will benefit from the services that the Forter cartridge provides.

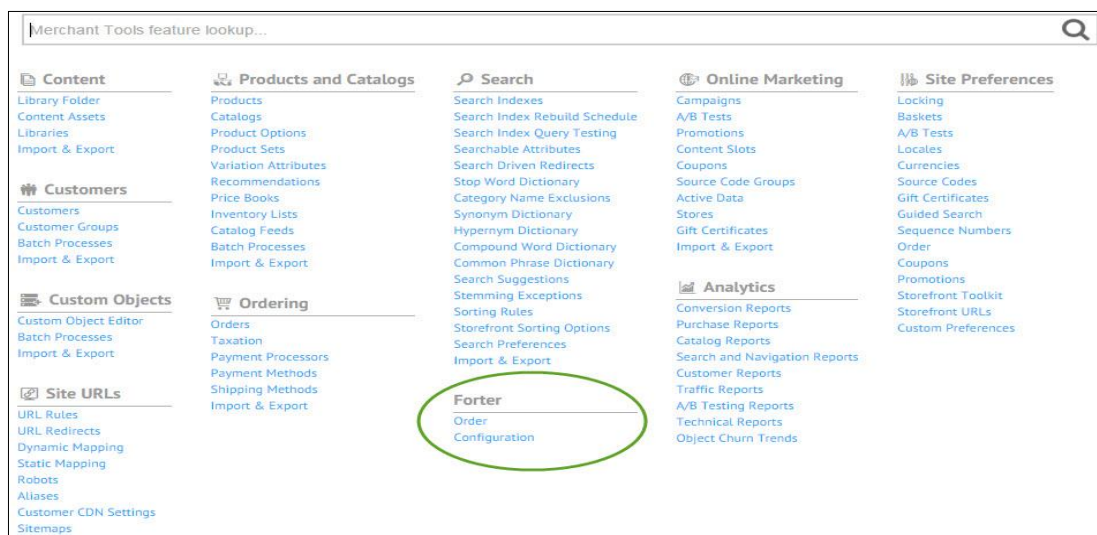

### 5.2 Business Manager

The Forter cartridge adds a Business Manager extension. It is used to add and test Forter's configuration, and to track Forter orders.

The following screenshots show the changes added.

#### 5.2.1 Menu extension

A Forter site specific extension is added to the Business Manager. It adds two new functionalities: *Forter configuration* and *Forter orders*.

#### 5.2.2 Forter section

This new section has been added to the Site Preferences and here the merchant can set up the Forter configurations and/or check the status of orders.

## Forter

Set your fraud prevention preferences.

### Order

Manage the orders.

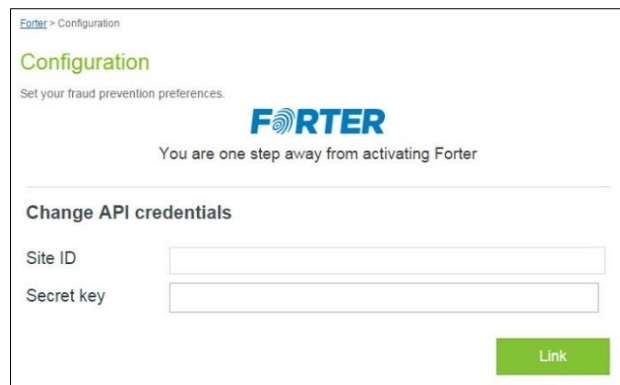

### Configuration

Configure Forter: Frictionless Fraud Prevention

### 5.2.3 *Forter configuration*

In the Forter dedicated section a specific SiteID and Secret Key should be provided. When a call to Forter is made, if the combination is valid then a second page for advanced Forter Configuration is shown.

Forter > Configuration

## Configuration

Set your fraud prevention preferences.

[Change API credentials](#) [Save](#)

Forter configurations are saved in Salesforce Commerce Cloud site preferences. They can be manipulated through the Forter -> Configuration extension screen. Please do not manipulate them directly through site preferences because this way no Forter call for verification is made.

## 5.2.4 Forter Orders

A Forter orders page is added. Thus the merchant can easily search for orders based on the Forter decision. The Forter Decision will influence the Order Status.

These are the possible Forter Decision values:

- **Approved** – Forter approves the transaction; **Merchant should capture the transaction funds, communicate the successful checkout to the customer and produce an invoice.**
- **Declined** – The order is suspected as fraudulent and Forter declines the transaction; **Merchant should cancel the transaction and communicate with the customer**
- **Not reviewed** – Forter does not have sufficient information in order to approve or decline the transaction; **Forter does not review the transaction, according to policy. Merchant should act according to the policy that was in place before integration with Forter** à merchant verifies data: approve/decline the order.
- **Error** – The information is not sent to Forter (**due to issues with the cartridge**). As noted above, *the merchant should configure the desired flow for this use case*. In the sample flow above orders are captured. *This should not happen. In case it does the merchant should reach out Forter customer support to investigate the issue.*
- **Not sent** – Orders not sent to Forter. This is the default status for all previous cartridge installation orders that are in the system.

Custom Order Column 4:  ...

### 5.2.5 Order Update job

The order update job checks for a Salesforce Commerce Cloud order status change, and sends it to the relevant Forter API endpoint via HTTPS. *It is recommended that the job be run every 6 hours.* Please note that in the Custom Site Preferences section you can configure the parameter **Number of weeks** that is used by this job to determine the time range (number of weeks) that the job queries in order to update order status. The default value is 4 weeks.

### 5.2.6 Forter API Version

We have a new functionality for changing the API version. Now, the API version can be changed directly from BM. You need to go to the Merchant Tools → Site Preferences, click on the forter preference and search for API Version attribute. The default value is 2.88 (the current version for forter API). You can change from there when a version shows up.

Forter Site ID (forterSiteID) (String) Forter Site ID	<input type="text" value="6b5eedb6126b"/>	<a href="#">Edit Across Sites</a>

## 5.3 Storefront Functionality

### 5.3.1 JavaScript Snippet

The Forter JavaScript snippet should be injected into the site footer section for all web pages. For this purpose, the following template has been built:

int\_forter/cartridge/templates/default/custom/fortersnippetjs.isml

```
<script>
(function () {
    document.addEventListener('ftr:tokenReady', function(evt) {
        var token = evt.detail;
        console.log(token);
        if (token != null) {
            var postInfo = {
                ftrToken : token
            };
            jQuery.ajax({
                type: "POST",
                url: "${dw.web.URLUtils.url('ForterValidate-UpdateForterInfo')}.toString()",
                data: postInfo,
                success: function(data) {}
            });
        }
    });
})();
</script>
<script type="text/javascript" id="<isprint value="${dw.system.Site.getCurrent().getCustomPreferenceValue('forterSiteID')}" />">
(function () {
    var merchantConfig = {
        csp: false
    };
    You, now + Uncommitted changes
    var siteId = "<isprint value="${dw.system.Site.getCurrent().getCustomPreferenceValue('forterSiteID')}" />";
